## Chapter 1

# Deprecated List

Global `setup_extern_devices` (`void *argument`)

I really dunno why this still exists, but this gets called somewhere so Im leaving it. I think we just pass it NULL.

## Chapter 2

### 2.1 Modules

Here is a list of all modules:

State Engine . . . . .	9
State Engine API . . . . .	15
State Engine Internals . . . . .	29
UVFR Utilities . . . . .	41
Utility Macros . . . . .	42
UVFR Vehicle Commands . . . . .	48
UVFR CANbus API . . . . .	49
CMSIS . . . . .	50
Stm32f4xx_system . . . . .	51
STM32F4xx_System_Private_Includes . . . . .	52
STM32F4xx_System_Private_TypesDefinitions . . . . .	53
STM32F4xx_System_Private_Defines . . . . .	54
STM32F4xx_System_Private_Macros . . . . .	55
STM32F4xx_System_Private_Variables . . . . .	56
STM32F4xx_System_Private_FunctionPrototypes . . . . .	57
STM32F4xx_System_Private_Functions . . . . .	58

## Chapter 3

# Data Structure Index

### 3.1 Data Structures

Here are the data structures with brief descriptions:

<a href="#">access_control_info</a>	59
<a href="#">bms_settings_t</a>	60
<a href="#">CAN_Callback</a>	60
<a href="#">daq_child_task</a>	61
<a href="#">daq_datapoint</a>	
This struct holds info of what needs to be logged	63
<a href="#">daq_loop_args</a>	64
<a href="#">daq_param_list_node</a>	65
<a href="#">driving_loop_args</a>	66
<a href="#">drivingLoopArgs</a>	
Arguments for the driving loop. The reason this is a struct passed in as an argument, rather than a bunch of global variables or constants is to allow the code to take settings from flash memory, therefore allowing the team to meet it's goal of having an actual GUI to change vehicle settings	71
<a href="#">drivingMode</a>	
This is where the driving mode and the <a href="#">drivingModeParams</a> are at	71
<a href="#">drivingModeParams</a>	
This struct is designed to hold information about each drivingmode's map params	73
<a href="#">exp_torque_map_args</a>	
Struct to hold parameters used in an exponential torque map	74
<a href="#">linear_torque_map_args</a>	74
<a href="#">motor_controllor_settings</a>	75
<a href="#">p_status</a>	77
<a href="#">rbnode</a>	
Node of a Red-Black binary search tree	78
<a href="#">rbtree</a>	
Struct representing a binary search tree	79
<a href="#">s_curve_torque_map_args</a>	
Struct for s-curve parameters for torque	82
<a href="#">state_change_daemon_args</a>	83
<a href="#">task_management_info</a>	
Struct to contain data about a parent task	84
<a href="#">task_status_block</a>	
Information about the task	85
<a href="#">uv_binary_semaphore_info</a>	85
<a href="#">uv_CAN_msg</a>	
Representative of a CAN message	86

<a href="#">uv_init_struct</a>	88
<a href="#">uv_init_task_args</a>	
Struct designed to act like the <a href="#">uv_task_info</a> struct, but for the initialisation tasks. As a result it takes fewer arguments	88
<a href="#">uv_init_task_response</a>	
Struct representing the response of one of the initialization tasks	89
<a href="#">uv_internal_params</a>	
Data used by the uvfr_utils library to do what it needs to do :)	91
<a href="#">uv_mutex_info</a>	92
<a href="#">uv_os_settings</a>	
Settings that dictate state engine behavior	93
<a href="#">uv_scd_response</a>	94
<a href="#">uv_semaphore_info</a>	95
<a href="#">uv_task_info</a>	
This struct is designed to hold neccessary information about an RTOS task that will be managed by uvfr_state_engine	96
<a href="#">uv_task_msg_t</a>	
Struct containing a message between two tasks	101
<a href="#">uv_vehicle_settings</a>	103
<a href="#">veh_gen_info</a>	105

## Chapter 4

# File Index

### 4.1 File List

Here is a list of all files with brief descriptions:

Core/Inc/ <a href="#">adc.h</a>	
This file contains all the function prototypes for the <a href="#">adc.c</a> file	107
Core/Inc/ <a href="#">bms.h</a>	111
Core/Inc/ <a href="#">can.h</a>	
This file contains all the function prototypes for the <a href="#">can.c</a> file	112
Core/Inc/ <a href="#">constants.h</a>	116
Core/Inc/ <a href="#">daq.h</a>	118
Core/Inc/ <a href="#">dash.h</a>	122
Core/Inc/ <a href="#">dma.h</a>	
This file contains all the function prototypes for the <a href="#">dma.c</a> file	123
Core/Inc/ <a href="#">driving_loop.h</a>	124
Core/Inc/ <a href="#">errorLUT.h</a>	129
Core/Inc/ <a href="#">FreeRTOSConfig.h</a>	129
Core/Inc/ <a href="#">gpio.h</a>	
This file contains all the function prototypes for the <a href="#">gpio.c</a> file	141
Core/Inc/ <a href="#">imd.h</a>	141
Core/Inc/ <a href="#">main.h</a>	
: Header for <a href="#">main.c</a> file. This file contains the common defines of the application	149
Core/Inc/ <a href="#">motor_controller.h</a>	152
Core/Inc/ <a href="#">odometer.h</a>	159
Core/Inc/ <a href="#">oled.h</a>	160
Core/Inc/ <a href="#">pdu.h</a>	162
Core/Inc/ <a href="#">rb_tree.h</a>	166
Core/Inc/ <a href="#">spi.h</a>	
This file contains all the function prototypes for the <a href="#">spi.c</a> file	172
Core/Inc/ <a href="#">stm32f4xx_hal_conf.h</a>	
HAL configuration template file. This file should be copied to the application folder and renamed to <a href="#">stm32f4xx_hal_conf.h</a>	173
Core/Inc/ <a href="#">stm32f4xx_it.h</a>	
This file contains the headers of the interrupt handlers	194
Core/Inc/ <a href="#">temp_monitoring.h</a>	198
Core/Inc/ <a href="#">tim.h</a>	
This file contains all the function prototypes for the <a href="#">tim.c</a> file	199
Core/Inc/ <a href="#">uvfr_global_config.h</a>	200
Core/Inc/ <a href="#">uvfr_settings.h</a>	201

Core/Inc/ <a href="#">uvfr_state_engine.h</a>	203
Core/Inc/ <a href="#">uvfr_utils.h</a>	209
Core/Inc/ <a href="#">uvfr_vehicle_commands.h</a>	221
Core/Src/ <a href="#">adc.c</a>	
This file provides code for the configuration of the ADC instances	225
Core/Src/ <a href="#">bms.c</a>	227
Core/Src/ <a href="#">can.c</a>	
This file provides code for the configuration of the CAN instances	228
Core/Src/ <a href="#">constants.c</a>	235
Core/Src/ <a href="#">daq.c</a>	236
Core/Src/ <a href="#">dash.c</a>	239
Core/Src/ <a href="#">dma.c</a>	
This file provides code for the configuration of all the requested memory to memory DMA transfers	240
Core/Src/ <a href="#">driving_loop.c</a>	
File containing the meat and potatoes driving loop thread, and all supporting functions	241
Core/Src/ <a href="#">freertos.c</a>	244
Core/Src/ <a href="#">gpio.c</a>	
This file provides code for the configuration of all used GPIO pins	248
Core/Src/ <a href="#">imd.c</a>	249
Core/Src/ <a href="#">main.c</a>	
: Main program body	260
Core/Src/ <a href="#">motor_controller.c</a>	266
Core/Src/ <a href="#">odometer.c</a>	271
Core/Src/ <a href="#">oled.c</a>	273
Core/Src/ <a href="#">pdu.c</a>	273
Core/Src/ <a href="#">rb_tree.c</a>	276
Core/Src/ <a href="#">spi.c</a>	
This file provides code for the configuration of the SPI instances	281
Core/Src/ <a href="#">stm32f4xx_hal_msp.c</a>	
This file provides code for the MSP Initialization and de-Initialization codes	283
Core/Src/ <a href="#">stm32f4xx_hal_timebase_tim.c</a>	
HAL time base based on the hardware TIM	284
Core/Src/ <a href="#">stm32f4xx_it.c</a>	
Interrupt Service Routines	286
Core/Src/ <a href="#">syscalls.c</a>	
STM32CubeIDE Minimal System calls file	291
Core/Src/ <a href="#">systemem.c</a>	
STM32CubeIDE System Memory calls file	296
Core/Src/ <a href="#">system_stm32f4xx.c</a>	
CMSIS Cortex-M4 Device Peripheral Access Layer System Source File	298
Core/Src/ <a href="#">temp_monitoring.c</a>	299
Core/Src/ <a href="#">tim.c</a>	
This file provides code for the configuration of the TIM instances	301
Core/Src/ <a href="#">uvfr_settings.c</a>	302
Core/Src/ <a href="#">uvfr_state_engine.c</a>	
File containing the implementation of the vehicle's state engine and error handling infrastructure	305
Core/Src/ <a href="#">uvfr_utils.c</a>	307
Core/Src/ <a href="#">uvfr_vehicle_commands.c</a>	313

## Chapter 5

# Module Documentation

### 5.1 State Engine

Module containing all of the functions needed for the vehicle state machine to work.

#### Modules

- [State Engine API](#)  
*Provides publically available API for controlling vehicle state and error handling.*
- [State Engine Internals](#)

#### Data Structures

- struct [state\\_change\\_daemon\\_args](#)

#### Macros

- #define [MAX\\_NUM\\_MANAGED\\_TASKS](#) 16

#### Typedefs

- typedef struct [state\\_change\\_daemon\\_args](#) [state\\_change\\_daemon\\_args](#)

#### Functions

- void [uvSVCTaskManager](#) (void \*args)  
*oversees all of the service tasks, and makes sure that theyre alright*
- int [compareTaskByName](#) ([uv\\_task\\_info](#) \*t1, [uv\\_task\\_info](#) \*t2)

## Variables

- static `uv_task_id_next_task_id` = 0
- static `uv_task_info * _task_register` = NULL
- static `uv_task_id_next_svc_task_id` = 0
- `TaskHandle_t * scd_handle_ptr`
- static volatile `bool SCD_active` = false
- static `QueueHandle_t state_change_queue` = NULL
- `rbtree * task_name_lut` = NULL
- enum `uv_vehicle_state_t vehicle_state` = UV\_BOOT
- enum `uv_vehicle_state_t previous_state` = UV\_BOOT
- `uv_task_info * task_manager` = NULL
- `uv_task_info * svc_task_manager` = NULL
- `rbtree * task_name_tree`
- `uv_os_settings default_os_settings`

### 5.1.1 Detailed Description

Module containing all of the functions needed for the vehicle state machine to work.

The state-engine is mission critical code for doing the following:

- Providing a state machine for the vehicle
- Providing infrastructure necessary for the vehicle to change state, and behaving as a parent to all the RTOS tasks
- Providing an API to hide the nitty-gritty of interfacing with the operating system, mitigating race conditions, etc...

### 5.1.2 Macro Definition Documentation

#### 5.1.2.1 MAX\_NUM\_MANAGED\_TASKS

```
#define MAX_NUM_MANAGED_TASKS 16
```

Definition at line 20 of file `uvfr_state_engine.c`.

### 5.1.3 Typedef Documentation

#### 5.1.3.1 state\_change\_daemon\_args

```
typedef struct state_change_daemon_args state_change_daemon_args
```

## 5.1.4 Function Documentation

### 5.1.4.1 compareTaskByName()

```
int compareTaskByName (
    uv_task_info * t1,
    uv_task_info * t2 )
```

Definition at line 1320 of file uvfr\_state\_engine.c.

References uv\_task\_info::task\_name.

### 5.1.4.2 uvSVCTaskManager()

```
void uvSVCTaskManager (
    void * args )
```

oversees all of the service tasks, and makes sure that theyre alright

Start all of the service tasks. This involves allocating neccessary memory, setting the appropriate task parameters, and saying "fuck it we ball" and adding the tasks to the central task tracking data structure.

Now we deinitialize the svcTaskManager. This is done by doing the following:

- actually shut down the svc tasks
- double check that the tasks have acually shut down
- if any svc tasks are resisting nature's call, they will be shut down forcibly
- deallocate data structures specific to uvSVCTaskManager

Lovely times for all

Definition at line 1261 of file uvfr\_state\_engine.c.

References \_\_uvInitPanic(), \_task\_register, uv\_task\_info::active\_states, CAN\_RX\_DAEMON\_NAME, CAN\_TX\_DAEMON\_NAME, CANbusRxSvcDaemon(), CANbusTxSvcDaemon(), uv\_task\_info::task\_function, task\_management\_info::task\_handle, uv\_task\_info::task\_name, uvCreateServiceTask(), and uvStartTask().

Referenced by uvStartStateMachine().

## 5.1.5 Variable Documentation

#### 5.1.5.1 `_next_svc_task_id`

```
uv_task_id _next_svc_task_id = 0 [static]
```

Definition at line 28 of file `uvfr_state_engine.c`.

Referenced by `uvCreateServiceTask()`.

#### 5.1.5.2 `_next_task_id`

```
uv_task_id _next_task_id = 0 [static]
```

Definition at line 25 of file `uvfr_state_engine.c`.

Referenced by `_stateChangeDaemon()`, `killEmAll()`, `uvCreateServiceTask()`, `uvCreateTask()`, and `uvValidateManagedTasks()`.

#### 5.1.5.3 `_task_register`

```
uv_task_info* _task_register = NULL [static]
```

Definition at line 26 of file `uvfr_state_engine.c`.

Referenced by `_stateChangeDaemon()`, `_uvValidateSpecificTask()`, `killEmAll()`, `proccessSCDMsg()`, `uvCreateServiceTask()`, `uvCreateTask()`, `uvInitStateEngine()`, and `uvSVCTaskManager()`.

#### 5.1.5.4 `default_os_settings`

```
uv_os_settings default_os_settings
```

##### Initial value:

```
={  
    .svc_task_manager_period = 50,  
    .task_manager_period = 50,  
    .max_svc_task_period = 250,  
    .max_task_period = 500,  
}
```

Definition at line 47 of file `uvfr_state_engine.c`.

Referenced by `setupDefaultSettings()`.

#### 5.1.5.5 previous\_state

```
enum uv_vehicle_state_t previous_state = UV_BOOT
```

Definition at line 40 of file uvfr\_state\_engine.c.

Referenced by changeVehicleState(), and uvStartStateMachine().

#### 5.1.5.6 SCD\_active

```
volatile bool SCD_active = false [static]
```

Definition at line 34 of file uvfr\_state\_engine.c.

Referenced by \_stateChangeDaemon().

#### 5.1.5.7 scd\_handle\_ptr

```
TaskHandle_t* scd_handle_ptr

- #define [uvTaskDelayUntil](#)(x, lasttim, per)  
*State engine aware vTaskDelayUntil wrapper.*

## Typedefs

- typedef enum `uv_vehicle_state_t` `uv_vehicle_state`  
*Type representing the overall state and operating mode of the vehicle.*
- typedef enum `uv_task_cmd_e` `uv_task_cmd`  
*Special commands used to start and shutdown tasks.*
- typedef struct `uv_scd_response` `uv_scd_response`
- typedef enum `uv_task_state_t` `uv_task_status`  
*Enum representing the state of a managed task.*
- typedef enum `task_priority` `task_priority`  
*Priority of a managed task. Maps directly to OS priority.*
- typedef struct `task_management_info` `task_management_info`  
*Struct to contain data about a parent task.*
- typedef struct `task_status_block` `task_status_block`  
*Information about the task.*
- typedef struct `uv_os_settings` `uv_os_settings`  
*Settings that dictate state engine behavior.*
- typedef struct `uv_task_info` `uv_task_info`  
*This struct is designed to hold necessary information about an RTOS task that will be managed by uvfr\_state\_↔ engine.*

## Enumerations

- enum `uv_vehicle_state_t` {  
  `UV_INIT` = 0x0001, `UV_READY` = 0x0002, `PROGRAMMING` = 0x0004, `UV_DRIVING` = 0x0008,  
  `UV_SUSPENDED` = 0x0010, `UV_LAUNCH_CONTROL` = 0x0020, `UV_ERROR_STATE` = 0x0040,  
  `UV_BOOT` = 0x0080,  
  `UV_HALT` = 0x0100 }  
*Type representing the overall state and operating mode of the vehicle.*
- enum `uv_task_cmd_e` { `UV_NO_CMD`, `UV_KILL_CMD`, `UV_SUSPEND_CMD`, `UV_TASK_START_CMD` }  
*Special commands used to start and shutdown tasks.*
- enum `uv_scd_response_e` {  
  `UV_SUCCESSFUL_DELETION`, `UV_SUCCESSFUL_SUSPENSION`, `UV_COULDNT_DELETE`, `UV_COULDNT_SUSPEND`,  
  `UV_UNSAFE_STATE` }  
*Response from a task confirming it has been either deleted or suspended.*
- enum `uv_task_state_t` { `UV_TASK_NOT_STARTED`, `UV_TASK_DELETED`, `UV_TASK_RUNNING`,  
  `UV_TASK_SUSPENDED` }  
*Enum representing the state of a managed task.*
- enum `task_priority` {  
  `IDLE_TASK_PRIORITY`, `LOW_PRIORITY`, `BELOW_NORMAL`, `MEDIUM_PRIORITY`,  
  `ABOVE_NORMAL`, `HIGH_PRIORITY`, `REALTIME_PRIORITY` }  
*Priority of a managed task. Maps directly to OS priority.*

## Functions

- `uv_status changeVehicleState` (uint16\_t state)  
*Function for changing the state of the vehicle, as well as the list of active + inactive tasks.*
- `uv_status uvInitStateEngine` ()  
*Function that prepares the state engine to do its thing.*
- `uv_status uvStartStateMachine` ()  
*Actually starts up the state engine to do state engine things.*
- `uv_status uvDelnitStateEngine` ()  
*Stops and frees all resources used by uvfr\_state\_engine.*
- `uv_task_info * uvCreateTask` ()  
*This function gets called when you want to create a task, and register it with the task register. Theres some gnarliness here, but not unacceptable levels. Pray this thing doesn't hang itself.*

### 5.2.1 Detailed Description

Provides publically available API for controlling vehicle state and error handling.

The functions defined in this group are publicly accessible and can be called from either application or service tasks. These are not necessarily interrupt safe, and therefore should not be called from them, unless they end with FromISR

### 5.2.2 Macro Definition Documentation

#### 5.2.2.1 UV\_TASK\_AWAITING\_DELETION

```
#define UV_TASK_AWAITING_DELETION 0x0001U<<(9)
```

Definition at line 193 of file uvfr\_state\_engine.h.

#### 5.2.2.2 UV\_TASK\_DEADLINE\_FIRM

```
#define UV_TASK_DEADLINE_FIRM 0x0001U<<(12)
```

Definition at line 197 of file uvfr\_state\_engine.h.

#### 5.2.2.3 UV\_TASK\_DEADLINE\_HARD

```
#define UV_TASK_DEADLINE_HARD (0x0001U<<(11)|0x0001U<<(12))
```

Definition at line 198 of file uvfr\_state\_engine.h.

#### 5.2.2.4 UV\_TASK\_DEADLINE\_MASK

```
#define UV_TASK_DEADLINE_MASK (0x0001U<<(11)|0x0001U<<(12))
```

Definition at line 199 of file uvfr\_state\_engine.h.

#### 5.2.2.5 UV\_TASK\_DEADLINE\_NOT\_ENFORCED

```
#define UV_TASK_DEADLINE_NOT_ENFORCED 0x00
```

Definition at line 195 of file uvfr\_state\_engine.h.

#### 5.2.2.6 UV\_TASK\_DEFER\_DELETION

```
#define UV_TASK_DEFER_DELETION 0x0001U<<(10)
```

Definition at line 194 of file uvfr\_state\_engine.h.

#### 5.2.2.7 UV\_TASK\_DELAYING

```
#define UV_TASK_DELAYING 0x0001U<<(14)
```

Definition at line 201 of file uvfr\_state\_engine.h.

#### 5.2.2.8 UV\_TASK\_DORMANT\_SVC

```
#define UV_TASK_DORMANT_SVC 0b0000000000000011
```

Definition at line 183 of file uvfr\_state\_engine.h.

#### 5.2.2.9 UV\_TASK\_ERR\_IN\_CHILD

```
#define UV_TASK_ERR_IN_CHILD 0x0001U<<(8)
```

Definition at line 192 of file uvfr\_state\_engine.h.

#### 5.2.2.10 UV\_TASK\_GENERIC\_SVC

```
#define UV_TASK_GENERIC_SVC 0x0001U<<(2)
```

Definition at line 184 of file uvfr\_state\_engine.h.

### 5.2.2.11 UV\_TASK\_IS\_CHILD

```
#define UV_TASK_IS_CHILD 0x0001U<<(6)
```

Definition at line 190 of file uvfr\_state\_engine.h.

### 5.2.2.12 UV\_TASK\_IS\_ORPHAN

```
#define UV_TASK_IS_ORPHAN 0x0001U<<(7)
```

Definition at line 191 of file uvfr\_state\_engine.h.

### 5.2.2.13 UV\_TASK\_IS\_PARENT

```
#define UV_TASK_IS_PARENT 0x0001U<<(5)
```

Definition at line 189 of file uvfr\_state\_engine.h.

### 5.2.2.14 UV\_TASK\_LOG\_MEM\_USAGE

```
#define UV_TASK_LOG_MEM_USAGE 0x0001U<<(3)
```

Definition at line 187 of file uvfr\_state\_engine.h.

### 5.2.2.15 UV\_TASK\_LOG\_START\_STOP\_TIME

```
#define UV_TASK_LOG_START_STOP_TIME 0x0001U<<(2)
```

Definition at line 186 of file uvfr\_state\_engine.h.

### 5.2.2.16 UV\_TASK\_MANAGER\_MASK

```
#define UV_TASK_MANAGER_MASK 0b0000000000000011
```

Definition at line 185 of file uvfr\_state\_engine.h.

#### 5.2.2.17 UV\_TASK\_MISSION\_CRITICAL

```
#define UV_TASK_MISSION_CRITICAL 0x0001U<<(13)
```

Definition at line 200 of file uvfr\_state\_engine.h.

#### 5.2.2.18 UV\_TASK\_PERIODIC\_SVC

```
#define UV_TASK_PERIODIC_SVC 0x0001U<<(1)
```

Definition at line 182 of file uvfr\_state\_engine.h.

#### 5.2.2.19 UV\_TASK\_PRIO\_INCREMENTATION

```
#define UV_TASK_PRIO_INCREMENTATION 0x0001U<<(11)
```

Definition at line 196 of file uvfr\_state\_engine.h.

#### 5.2.2.20 UV\_TASK\_SCD\_IGNORE

```
#define UV_TASK_SCD_IGNORE 0x0001U<<(4)
```

Definition at line 188 of file uvfr\_state\_engine.h.

#### 5.2.2.21 UV\_TASK\_VEHICLE\_APPLICATION

```
#define UV_TASK_VEHICLE_APPLICATION 0x0001U<<(0)
```

Definition at line 181 of file uvfr\_state\_engine.h.

#### 5.2.2.22 uvTaskDelay

```
#define uvTaskDelay(  
    x,  
    t )
```

**Value:**

```
uvTaskSetDelayBit(x);\n    vTaskDelay(t);\n    uvTaskResetDelayBit(x)
```

State engine aware vTaskDelay wrapper.

Parameters

<i>x</i>	
<i>t</i>	is how long to delay in ticks

Definition at line 274 of file uvfr\_state\_engine.h.

### 5.2.2.23 uvTaskDelayUntil

```
#define uvTaskDelayUntil(  
    x,  
    lasttim,  
    per )
```

**Value:**

```
uvTaskSetDelayBit(x);\n    vTaskDelayUntil(&lasttim,per);\n    uvTaskResetDelayBit(x)
```

State engine aware vTaskDelayUntil wrapper.

Parameters

<i>x</i>	
<i>lasttim</i>	is the variable storing the last delay time.
<i>per</i>	is the period.

This will cause the task to wait until the last time + the period.

Definition at line 286 of file uvfr\_state\_engine.h.

### 5.2.2.24 uvTaskIsDelaying

```
#define uvTaskIsDelaying(  
    t ) ((t->task_flags&UV_TASK_DELAYING)==UV_TASK_DELAYING)
```

Definition at line 267 of file uvfr\_state\_engine.h.

### 5.2.2.25 uvTaskResetDelayBit

```
#define uvTaskResetDelayBit(  
    t ) (t->task_flags&=(~UV_TASK_DELAYING))
```

Definition at line 265 of file uvfr\_state\_engine.h.

#### 5.2.2.26 uvTaskResetDeletionBit

```
#define uvTaskResetDeletionBit(  
    t ) (t->task_flags &= (~UV_TASK_AWAITING_DELETION))
```

Definition at line 261 of file uvfr\_state\_engine.h.

#### 5.2.2.27 uvTaskSetDelayBit

```
#define uvTaskSetDelayBit(  
    t ) (t->task_flags|=UV_TASK_DELAYING)
```

Definition at line 263 of file uvfr\_state\_engine.h.

#### 5.2.2.28 uvTaskSetDeletionBit

```
#define uvTaskSetDeletionBit(  
    t ) (t->task_flags|=UV_TASK_AWAITING_DELETION)
```

Definition at line 260 of file uvfr\_state\_engine.h.

### 5.2.3 Typedef Documentation

#### 5.2.3.1 task\_management\_info

```
typedef struct task_management_info task_management_info
```

Struct to contain data about a parent task.

This contains the information required for the child task to communicate with it's parent.

This will be a queue, since one parent task can in theory have several child tasks

#### 5.2.3.2 task\_priority

```
typedef enum task_priority task_priority
```

Priority of a managed task. Maps directly to OS priority.

### 5.2.3.3 task\_status\_block

```
typedef struct task_status_block task_status_block
```

Information about the task.

### 5.2.3.4 uv\_os\_settings

```
typedef struct uv_os_settings uv_os_settings
```

Settings that dictate state engine behavior.

### 5.2.3.5 uv\_scd\_response

```
typedef struct uv_scd_response uv_scd_response
```

### 5.2.3.6 uv\_task\_cmd

```
typedef enum uv_task_cmd_e uv_task_cmd
```

Special commands used to start and shutdown tasks.

### 5.2.3.7 uv\_task\_info

```
typedef struct uv_task_info uv_task_info
```

This struct is designed to hold necessary information about an RTOS task that will be managed by uvfr\_state\_↔ engine.

Pay close attention, because this is one of the most cursed structs in the project, as well as one of the most important

### 5.2.3.8 uv\_task\_status

```
typedef enum uv_task_state_t uv_task_status
```

Enum representing the state of a managed task.

This is used as a flag to indicate whether or not the state\_engine is aware of a task is running or not.

### 5.2.3.9 uv\_vehicle\_state

```
typedef enum uv_vehicle_state_t uv_vehicle_state
```

Type representing the overall state and operating mode of the vehicle.

Type made to represent the state of the vehicle, and the location in the state machine The states are powers of two to make it easier to discern tasks that need to happen in multiple states

## 5.2.4 Enumeration Type Documentation

### 5.2.4.1 task\_priority

```
enum task_priority
```

Priority of a managed task. Maps directly to OS priority.

Enumerator

IDLE_TASK_PRIORITY	
LOW_PRIORITY	
BELOW_NORMAL	
MEDIUM_PRIORITY	
ABOVE_NORMAL	
HIGH_PRIORITY	
REALTIME_PRIORITY	

Definition at line 135 of file uvfr\_state\_engine.h.

### 5.2.4.2 uv\_scd\_response\_e

```
enum uv_scd_response_e
```

Response from a task confirming it has been either deleted or suspended.

Enumerator

UV_SUCCESSFUL_DELETION	Returned when a task was successfully deleted
UV_SUCCESSFUL_SUSPENSION	Returned when a task is successfully suspended
UV_COULDNT_DELETE	Task was not successfully deleted
UV_COULDNT_SUSPEND	Task was not successfully suspended
UV_UNSAFE_STATE	Task has ended up in a fucked middle ground state

Definition at line 106 of file uvfr\_state\_engine.h.

#### 5.2.4.3 uv\_task\_cmd\_e

```
enum uv_task_cmd_e
```

Special commands used to start and shutdown tasks.

Enumerator

UV_NO_CMD	The SCD has issued no command, and therefore no action is required
UV_KILL_CMD	The SCD has decreed that this task must be deleted
UV_SUSPEND_CMD	The SCD has decreed that this task must be suspended
UV_TASK_START_CMD	OK for task to begin execution

Definition at line 96 of file uvfr\_state\_engine.h.

#### 5.2.4.4 uv\_task\_state\_t

```
enum uv_task_state_t
```

Enum representing the state of a managed task.

This is used as a flag to indicate whether or not the state\_engine is aware of a task is running or not.

Enumerator

UV_TASK_NOT_STARTED	
UV_TASK_DELETED	
UV_TASK_RUNNING	
UV_TASK_SUSPENDED	

Definition at line 124 of file uvfr\_state\_engine.h.

#### 5.2.4.5 uv\_vehicle\_state\_t

```
enum uv_vehicle_state_t
```

Type representing the overall state and operating mode of the vehicle.

Type made to represent the state of the vehicle, and the location in the state machine The states are powers of two to make it easier to discern tasks that need to happen in multiple states

## Enumerator

UV_INIT	Vehicle is in the process of initializing
UV_READY	Vehicle has initialized and is ready to drive
PROGRAMMING	The settings of the vehicle are being edited now
UV_DRIVING	The vehicle is actively driving
UV_SUSPENDED	The vehicle is not allowed to produce any torque, but not full shutdown
UV_LAUNCH_CONTROL	The vehicle is presently in launch control mode
UV_ERROR_STATE	Some error has occurred here
UV_BOOT	Pre-init, when the boot loader is going
UV_HALT	Stop literally everything, except for what is needed to reset vehicle

Definition at line 81 of file uvfr\_state\_engine.h.

## 5.2.5 Function Documentation

### 5.2.5.1 changeVehicleState()

```
uv_status changeVehicleState (
    uint16_t state )
```

Function for changing the state of the vehicle, as well as the list of active + inactive tasks.

This function also changes out the tasks that are executing, by invoking the legendary `_state_change_daemon`

## Parameters

<i>state</i>	is a member of <code>uv_status</code> , and therefore a power of two
--------------	--

## Return values

<i>returns</i>	a memeber of <code>uv_status</code> depending on whether execution is successful
----------------	--

## Example usage:

```
if ((brakepedal_pressed == true) && (start_button_pressed == true)) {
    changeVehicleState(UV_DRIVING);
}
```

As you can see, all you need to do is specify the new state. Naturally, the task should be ready to get deleted by the `state_change_daemon`, but that is neither here nor there. If the state we wish to change to is the same as the state we're in, then no need to be executing any of this fancy code

Transition from UV\_INIT to UV\_READY states

Transition from UV\_INIT to UV\_ERROR states

Definition at line 89 of file uvfr\_state\_engine.c.

References `_stateChangeDaemon()`, `isPowerOfTwo`, `state_change_daemon_args::meta_task_handle`, `previous_↵`  
`state`, `UV_ABORTED`, `UV_ERROR`, `UV_ERROR_STATE`, `UV_INIT`, `UV_OK`, `UV_READY`, and `vehicle_state`.

Referenced by `daqMasterTask()`, `testfunc()`, and `uvInit()`.

### 5.2.5.2 uvCreateTask()

```
uv_task_info* uvCreateTask ( )
```

This function gets called when you want to create a task, and register it with the task register. There's some gnarliness here, but not unacceptable levels. Pray this thing doesn't hang itself.

Do not exceed the number of tasks available

Acquire the pointer to the spot in the array, we are doing this since we need to return the pointer anyways, and it cleans up the syntax a little.

Definition at line 252 of file `uvfr_state_engine.c`.

References `_next_task_id`, `_task_register`, `_UV_DEFAULT_TASK_STACK_SIZE`, `uv_task_info::active_states`, `uv_↵`  
`_task_info::deletion_states`, `MAX_NUM_MANAGED_TASKS`, `uv_task_info::parent`, `uv_task_info::stack_size`, `uv_↵`  
`_task_info::suspension_states`, `uv_task_info::task_flags`, `uv_task_info::task_function`, `uv_task_info::task_handle`,  
`uv_task_info::task_id`, `uv_task_info::task_name`, `uv_task_info::task_priority`, `uv_task_info::task_state`, `UV_TASK_↵`  
`_NOT_STARTED`, and `UV_TASK_VEHICLE_APPLICATION`.

Referenced by `initDaqTask()`, `initDrivingLoop()`, `initOdometer()`, and `initTempMonitor()`.

### 5.2.5.3 uvDeInitStateEngine()

```
uv_status uvDeInitStateEngine ( )
```

Stops and frees all resources used by `uvfr_state_engine`.

If we need to initialize the state engine, gotta de-initialize as well. This is the opposite of [uvInitStateEngine](#)

Definition at line 242 of file `uvfr_state_engine.c`.

References `killEmAll()`.

### 5.2.5.4 uvInitStateEngine()

```
uv_status uvInitStateEngine ( )
```

Function that prepares the state engine to do its thing.

This is called when the system is first starting up.

Definition at line 154 of file `uvfr_state_engine.c`.

References `__uvInitPanic()`, `_task_register`, `initDaqTask()`, `initDrivingLoop()`, `initOdometer()`, `initTempMonitor()`, `M_↵`  
`AX_NUM_MANAGED_TASKS`, `svc_task_manager`, `task_manager`, `UV_OK`, and `uvCreateServiceTask()`.

Referenced by `uvInit()`.

#### 5.2.5.5 uvStartStateMachine()

```
uv_status uvStartStateMachine ( )
```

Actually starts up the state engine to do state engine things.

This function ensures that all of the managed tasks are setup in a legal way, and then it allocates resources for, and starts the state engine and the background tasks. This unlocks the ability for the vehicle to do basically anything.

Definition at line 182 of file uvfr\_state\_engine.c.

References previous\_state, uv\_task\_info::stack\_size, svc\_task\_manager, uv\_task\_info::task\_flags, uv\_task\_info::task\_function, uv\_task\_info::task\_handle, task\_manager, uv\_task\_info::task\_name, uv\_task\_info::task\_period, UV\_ERROR, UV\_INIT, UV\_OK, UV\_TASK\_MISSION\_CRITICAL, UV\_TASK\_SCD\_IGNORE, uvSVCManager(), uvTaskManager(), uvValidateManagedTasks(), and vehicle\_state.

Referenced by uvInit().

## 5.3 State Engine Internals

### Functions

- `uv_status addTaskToTaskRegister (uv_task_id id, uint8_t assign_to_whom)`
- `uv_status _uvValidateSpecificTask (uv_task_id id)`  
*make sure the parameters of a task\_info struct is valid*
- `uv_status uvValidateManagedTasks ()`  
*ensure that all the tasks people have created actually make sense, and are valid*
- `uv_status uvStartTask (uint32_t *tracker, uv_task_info *t)`  
*: This is a function that starts tasks which are already registered in the system*
- `static uv_status uvKillTaskViolently (uv_task_info *t)`  
*if a task refuses to comply with the SCD, then it has no choice but to be deleted. There is nothing that can be done.*
- `uv_status uvDeleteTask (uint32_t *tracker, uv_task_info *t)`  
*deletes a managed task via the system*
- `uv_status uvAbortTaskDeletion (uv_task_info *t)`  
*If a task is scheduled for deletion, we want to be able to resurrect it.*
- `uv_status uvScheduleTaskDeletion (uint32_t *tracker, uv_task_info *t)`  
*Schedule a task to be deleted in the future double plus ungood imho.*
- `uv_status uvSuspendTask (uint32_t *tracker, uv_task_info *t)`  
*function to suspend one of the managed tasks.*
- `uv_status uvTaskCrashHandler (uv_task_info *t)`  
*Called when a task has crashed and we need to figure out what to do with it.*
- `void __uvPanic (char *msg, uint8_t msg_len, const char *file, const int line, const char *func)`  
*Something bad has occurred here now we in trouble.*
- `void killSelf (uv_task_info *t)`  
*This function is called by a task to nuke itself. Is a wrapper function that is used to do all the different things.*
- `void suspendSelf (uv_task_info *t)`  
*Called by a task that needs to suspend itself, once the task has determined it is safe to do so.*

### 5.3.1 Detailed Description

#### Attention

Do not edit these functions, or even contemplate calling one of them directly unless you 100% know what you are doing. These are DANGEROUS

This handles all the under the hood bullshit inherent to a system that dynamically starts and restarts RTOS tasks. Due to this being a safety critical system, great care must be taken to prevent the vehicle from entering an unsafe state as a result of anything happening in these functions.

### 5.3.2 Function Documentation

#### 5.3.2.1 \_\_uvPanic()

```
void __uvPanic (
    char * msg,
    uint8_t msg_len,
    const char * file,
    const int line,
    const char * func )
```

Something bad has occurred here now we in trouble.

General idea here: Something bad has happened that is severe enough that it requires the shutdown of the vehicle. This can mean several things, such as being on fire, etc... that need to be appropriately handled

This should also log whatever the fuck happened.

The following should happen, in order:

- Forcibly put vehicle into a safe state
- Change vehicle state to error, and invoke the SCD
- Log the error in our lil running journal

Should change vehicle state itself be the source of the error, we just need the software to completely fucking hang itself. If things are so fucked that we genuinely cannot even transition to the error state, then get that shit the fuck outta here, we shuttin down fr fr.

Definition at line 670 of file uvfr\_state\_engine.c.

References uvSecureVehicle().

#### 5.3.2.2 \_\_stateChangeDaemon()

```
void __stateChangeDaemon (
    void * args )
```

This collects all the data changing from different tasks, and makes sure that everything works properly.

#### Attention

DO NOT EVER JUST CALL THIS FUNCTION. THIS SHOULD ONLY BE CALLED FROM changeVehicleState

## Parameters

<i>args</i>	This accepts a <code>void*</code> pointer to avoid compile errors with freeRTOS, since freeRTOS expects a pointer to the function that accepts a void pointer
-------------	---

This is a one-shot RTOS task that spawns in when we want to change the state of the vehicle state. It performs this in the following way We get to iterate through all of the managed tasks. Goes via IDs as well. We load up the array entry as a temp pointer to a task info struct. As we go through it determines what to do by comparing the `uv_task_info.active_states` as well as `uv_task_info.deletion_states` and `uv_task_info.suspension_states` with `uv_vehicle_state`

This is done with the bitwise `&` operator, since the definition of the `uv_vehicle_state_t` enum facilitates this by only using factors of two.

Acquires pointer to task definition struct, then sets the queue in the struct to the SCD queue, so that the task actually does task things. Love when that happens. Next it sets the bit in the `task_tracker` corresponding to the task id, therefore marking that some action must be taken to either

- confirm that no action is necessary
- bring the task state into the correct state

Now we suspend the task because it has been misbehaving in school

Wait for all the tasks that had changes made to respond.

```

*/
uv_scd_response* response = NULL;
for(int i = 0; i < _LONGEST_SC_TIME/_SC_DAEMON_PERIOD; i++){ //This loop verifies to make sure things
are actually chillin
    vTaskDelay(_SC_DAEMON_PERIOD);
    for(int j = 0; j<10; j++){ //What kinda magic number is this? Why 10?
        if(xQueueReceive(state_change_queue, &response, 1) == pdPASS){
            if(response == NULL){//definatly not supposed to happen
                uvPanic("null scd response", 0);
            }
            if(processSCDMsg(response) == UV_OK){
                task_tracker &= (0x01<<response->meta_id);
                if (_task_register[response->meta_id].task_state == UV_TASK_DELETED){
                    _task_register[response->meta_id].task_handle = NULL;
                }
            }else{
                //Not ok, this means that process SCD has returned something weird. More detailed
                error_handling can be added later.
                uvPanic("Task giving Sass to SCD", 0);
            }
            if(uvFree(response) != UV_OK){
                uvPanic("failed to free memory", 0);
            }
            response = NULL;
        }else{
            break;
        }
    }
}
//You timed out didnt you... Naughty naughty...
if(task_tracker != 0){
    uvPanic("SCD Timeout", 0);
}
//TODO: Forcibly reconcile vehicle state, and nuke whatever tasks require nuking, suspend whatever needs
suspended
//END_OF_STATE_CHANGE_DAEMON:
//}
TaskHandle_t scd_handle = ((state_change_daemon_args*)args)->meta_task_handle;
uvFree(args);
vQueueDelete(state_change_queue);
state_change_queue = NULL;
/**

```

The final act of the SCD, is to delete itself

```

*/
vTaskDelete(scd_handle);

```

Definition at line 845 of file uvfr\_state\_engine.c.

References `_LONGEST_SC_TIME`, `_next_task_id`, `_SC_DAEMON_PERIOD`, `_task_register`, `uv_task_info::active_states`, `uv_task_info::deletion_states`, `uv_scd_response::meta_id`, `proccessSCDMsg()`, `SCD_active`, `state_change_queue`, `uv_task_info::suspension_states`, `uv_task_info::task_flags`, `uv_task_info::task_handle`, `uv_task_info::task_state`, `UV_OK`, `UV_TASK_AWAITING_DELETION`, `UV_TASK_DEFER_DELETION`, `UV_TASK_DELETED`, `UV_TASK_NOT_STARTED`, `UV_TASK_RUNNING`, `UV_TASK_SUSPENDED`, `uvDeleteTask()`, `uvScheduleTaskDeletion()`, `uvStartTask()`, `uvSuspendTask()`, and `vehicle_state`.

### 5.3.2.3 `_uvValidateSpecificTask()`

```
uv_status _uvValidateSpecificTask (
    uv_task_id id )
```

make sure the parameters of a `task_info` struct is valid

Definition at line 311 of file uvfr\_state\_engine.c.

References `_task_register`, `uv_task_info::active_states`, `uv_task_info::deletion_states`, `uv_task_info::suspension_states`, `uv_task_info::task_function`, `uv_task_info::task_name`, `UV_ERROR`, and `UV_OK`.

Referenced by `addTaskToTaskRegister()`, and `uvValidateManagedTasks()`.

### 5.3.2.4 `addTaskToTaskRegister()`

```
uv_status addTaskToTaskRegister (
    uv_task_id id,
    uint8_t assign_to_whom )
```

Definition at line 298 of file uvfr\_state\_engine.c.

References `_uvValidateSpecificTask()`, and `UV_OK`.

### 5.3.2.5 `killEmAll()`

```
uv_status killEmAll ( )
```

The name should be pretty self explanatory.

Definition at line 436 of file uvfr\_state\_engine.c.

References `_BV_32`, `_next_task_id`, `_task_register`, `UV_ERROR`, `UV_OK`, and `uvDeleteTask()`.

Referenced by `uvDelnitStateEngine()`.

### 5.3.2.6 killSelf()

```
void killSelf (
    uv_task_info * t )
```

This function is called by a task to nuke itself. Is a wrapper function that is used to do all the different things.

First lets load up the queue and the values in it. These come from the task we are doing.

Definition at line 688 of file uvfr\_state\_engine.c.

References `uv_task_info::cmd_data`, `uv_scd_response::meta_id`, `uv_scd_response::response_val`, `state_change_queue`, `uv_task_info::task_handle`, `uv_task_info::task_id`, `uv_task_info::task_state`, `UV_NO_CMD`, `UV_SUCCESSFUL_DELETION`, and `UV_TASK_DELETED`.

Referenced by `CANbusRxSvcDaemon()`, `CANbusTxSvcDaemon()`, `daqMasterTask()`, `odometerTask()`, `StartDrivingLoop()`, and `tempMonitorTask()`.

### 5.3.2.7 proccessSCDMsg()

```
static uv_status proccessSCDMsg (
    uv_scd_response * msg ) [static]
```

Helper function for the SCD, that proccesses a message, and double checks to make sure the task that sent the message isn't straight up lying to us.

This function is responsible for the following functionality:

- Make sure that the message claims that the deletion or suspension of a task is successful
- If a task claims that it is deleted, or suspended, then we must verify that this is the case

Get the id of the message, then use that to index the `_task_register` Mission critical stuff that stops ev from driving into a wall

Definition at line 772 of file uvfr\_state\_engine.c.

References `_task_register`, `uv_scd_response::meta_id`, `uv_scd_response::response_val`, `uv_task_info::task_handle`, `uv_task_info::task_state`, `UV_COULDNT_DELETE`, `UV_COULDNT_SUSPEND`, `UV_ERROR`, `UV_OK`, `UV_SUCCESSFUL_DELETION`, `UV_SUCCESSFUL_SUSPENSION`, `UV_TASK_DELETED`, and `UV_UNSAFE_STATE`.

Referenced by `_stateChangeDaemon()`.

### 5.3.2.8 suspendSelf()

```
void suspendSelf (
    uv_task_info * t )
```

Called by a task that needs to suspend itself, once the task has determined it is safe to do so.

Definition at line 729 of file uvfr\_state\_engine.c.

References `uv_task_info::cmd_data`, `uv_scd_response::meta_id`, `uv_scd_response::response_val`, `state_change_queue`, `uv_task_info::task_handle`, `uv_task_info::task_id`, `uv_task_info::task_state`, `UV_NO_CMD`, `UV_SUCCESSFUL_SUSPENSION`, and `UV_TASK_SUSPENDED`.

Referenced by `CANbusRxSvcDaemon()`, `CANbusTxSvcDaemon()`, `daqMasterTask()`, `odometerTask()`, `StartDrivingLoop()`, and `tempMonitorTask()`.

### 5.3.2.9 uvAbortTaskDeletion()

```
uv_status uvAbortTaskDeletion (
    uv_task_info * t )
```

If a task is scheduled for deletion, we want to be able to resurrect it.

Calling this will find the task deletion timer, and remove the task from the grave.

Definition at line 541 of file uvfr\_state\_engine.c.

References `UV_ERROR`, and `UV_OK`.

### 5.3.2.10 uvCreateServiceTask()

```
uv_task_info* uvCreateServiceTask ( )
```

Create a new service task, because fuck you, thats why.

Acquire the pointer to the spot in the array, we are doing this since we need to return the pointer anyways, and it cleans up the syntax a little.

Definition at line 1115 of file uvfr\_state\_engine.c.

References `_next_svc_task_id`, `_next_task_id`, `_task_register`, `_UV_DEFAULT_TASK_STACK_SIZE`, `uv_task_info::active_states`, `uv_task_info::deletion_states`, `MAX_NUM_MANAGED_TASKS`, `uv_task_info::parent`, `uv_task_info::stack_size`, `uv_task_info::suspension_states`, `uv_task_info::task_flags`, `uv_task_info::task_function`, `uv_task_info::task_handle`, `uv_task_info::task_id`, `uv_task_info::task_name`, `uv_task_info::task_priority`, `uv_task_info::task_state`, `UV_TASK_GENERIC_SVC`, `UV_TASK_NOT_STARTED`, and `UV_TASK_SCD_IGNORE`.

Referenced by `uvInitStateEngine()`, and `uvSVCTaskManager()`.

#### 5.3.2.11 uvDeleteSVCTask()

```
uv_status uvDeleteSVCTask (
    uv_task_info * t )
```

For when you need to delete a service task... for some reason...

Definition at line 1209 of file uvfr\_state\_engine.c.

References uv\_task\_info::cmd\_data, uv\_task\_info::task\_handle, uv\_task\_info::task\_state, UV\_ABORTED, UV\_ERROR, UV\_KILL\_CMD, UV\_OK, UV\_TASK\_DELETED, UV\_TASK\_NOT\_STARTED, UV\_TASK\_RUNNING, and UV\_TASK\_SUSPENDED.

Referenced by uvRestartSVCTask().

#### 5.3.2.12 uvDeleteTask()

```
uv_status uvDeleteTask (
    uint32_t * tracker,
    uv_task_info * t )
```

deletes a managed task via the system

This function is the lowtier god of the program. It pulls up and is like "YOU SHOULD KILL YOURSELF, NOW!!" It sends a message to the task which tells it to kill itself.

The task complies. It does not have a choice. This checks with the RTOS kernel to see that the task as stated by the scheduler matches the state known by uvfr\_utils

Definition at line 481 of file uvfr\_state\_engine.c.

References uv\_task\_info::cmd\_data, uv\_task\_info::task\_handle, uv\_task\_info::task\_id, uv\_task\_info::task\_state, UV\_ABORTED, UV\_ERROR, UV\_KILL\_CMD, UV\_OK, UV\_TASK\_DELETED, UV\_TASK\_NOT\_STARTED, UV\_TASK\_SUSPENDED, and uvTasksDelaying.

Referenced by \_stateChangeDaemon(), and killEmAll().

#### 5.3.2.13 uvGetTaskFromName()

```
uv_task_info* uvGetTaskFromName (
    char * tsk_name )
```

Sometimes you just gotta deal with it lol

Definition at line 1356 of file uvfr\_state\_engine.c.

#### 5.3.2.14 uvGetTaskFromRTOSHandle()

```
uv_task_info* uvGetTaskFromRTOSHandle (
    TaskHandle_t t_handle )
```

Returns the pointer to the task info structure.

## Parameters

<code>t_handle</code>	A freeRTOS task handle.
-----------------------	-------------------------

## Return values

A	pointer to a <code>uv_task_info</code> data structure. This is mostly useful for cases where you know the RTOS handle, but not the task info struct
---	---

Definition at line 1368 of file `uvfr_state_engine.c`.

### 5.3.2.15 uvInvokeSCD()

```
uv_status uvInvokeSCD (
    void * scd_params ) [inline]
```

used to wake up the SCD

This is only called from `uvTaskManager` to wake up the SCD

Definition at line 1026 of file `uvfr_state_engine.c`.

### 5.3.2.16 uvKillTaskViolently()

```
static uv_status uvKillTaskViolently (
    uv_task_info * t ) [static]
```

if a task refuses to comply with the SCD, then it has no choice but to be deleted. There is nothing that can be done.

You will not win against the operating system. The first thing that needs to happen, is we will tell the kernel to release any resources owned by the task.

Definition at line 457 of file `uvfr_state_engine.c`.

References `UV_OK`.

Referenced by `uvRestartSVCTask()`.

### 5.3.2.17 uvRestartSVCTask()

```
uv_status uvRestartSVCTask (
    uv_task_info * t )
```

Function that takes a service part that may be messed up and tries to reboot it to recover.

This may be necessary if a SVC task is not responding. Be careful though, since this has the potential to delay more important tasks :o Therefore, this technique should be used sparingly, and each task gets a limited number of attempts within a certain time period.

Definition at line 1237 of file `uvfr_state_engine.c`.

References `UV_ERROR`, `UV_OK`, `uvDeleteSVCTask()`, `uvKillTaskViolently()`, and `uvStartSVCTask()`.

#### 5.3.2.18 uvScheduleTaskDeletion()

```
uv_status uvScheduleTaskDeletion (  
    uint32_t *      *
```

### 5.3.2.21 uvStartTask()

```
uv_status uvStartTask (
    uint32_t * tracker,
    uv_task_info * t )
```

: This is a function that starts tasks which are already registered in the system

This bad boi gets called from the stateChangeDaemon because it's a special little snowflake. The first thing we will do is check if the task is running, since this could theoretically get called from literally anywhere. If the task is running, then we check to see if `t->task_handle` is set to `NULL`. If it is null, that is a physically impossible state. Neither very mindful or very demure.

That being said, if the task appears legit, then just update the corresponding bits in the tracker, and return that the task has aborted.

If a task has been suspended, we do not want to create a new instance of the task, because then the task will go out of scope, and changing the task handle to a new instance will result in the task never being de-initialized, therefore causing a memory leak. We want to call `vTaskResume` instead, and just boot the task back into existence.

If none of the previous if statements caught the task handle, then that means that either this is our first time attempting to activate this task, or the task has been deleted at some point prior to this one

Definition at line 368 of file `uvfr_state_engine.c`.

References `_BV_32`, `uv_task_info::stack_size`, `uv_task_info::task_function`, `uv_task_info::task_handle`, `uv_task_info::task_id`, `uv_task_info::task_name`, `uv_task_info::task_priority`, `uv_task_info::task_state`, `UV_ABORTED`, `UV_ERROR`, `UV_OK`, `UV_TASK_RUNNING`, and `UV_TASK_SUSPENDED`.

Referenced by `_stateChangeDaemon()`, and `uvSVCTaskManager()`.

### 5.3.2.22 uvSuspendSVCTask()

```
uv_status uvSuspendSVCTask (
    uv_task_info * t )
```

Function that suspends a service task.

Definition at line 1194 of file `uvfr_state_engine.c`.

References `uv_task_info::task_state`, `UV_ABORTED`, `UV_ERROR`, `UV_OK`, and `UV_TASK_SUSPENDED`.

### 5.3.2.23 uvSuspendTask()

```
uv_status uvSuspendTask (
    uint32_t * tracker,
    uv_task_info * t )
```

function to suspend one of the managed tasks.

## Parameters

<i>tracker</i>	is a pointer to an int. If the task actually suspends, we update the tracker, since no further action is needed.
<i>t</i>	is a pointer to a <a href="#">uv_task_info</a> struct.

Definition at line 580 of file `uvfr_state_engine.c`.

References `uv_task_info::cmd_data`, `uv_task_info::task_handle`, `uv_task_info::task_id`, `uv_task_info::task_state`, `UV_ERROR`, `UV_OK`, `UV_SUSPEND_CMD`, `UV_TASK_DELETED`, `UV_TASK_NOT_STARTED`, `UV_TASK_SUSPENDED`, and `uvTaskIsDelaying`.

Referenced by `_stateChangeDaemon()`.

### 5.3.2.24 uvTaskCrashHandler()

```
uv_status uvTaskCrashHandler (
    uv_task_info * t )
```

Called when a task has crashed and we need to figure out what to do with it.

Effectively, there are a couple variables we care about here: 1) Can the vehicle continue operation without that task active? 2) Do we really care?

If the task is critical, then this needs to 100% result in a panic. If it isn't then we can try to restart the task, noting that this may result in strange undefined behavior down the line. Thankfully if a task is not safety critical, we don't really care whether it misbehaves. Appropriate countermeasures are in place to prevent one task from overflowing into another task, as well as to mitigate against possible memory leaks.

Definition at line 637 of file `uvfr_state_engine.c`.

References `uv_task_info::task_flags`, `UV_ERROR`, `UV_OK`, and `UV_TASK_MISSION_CRITICAL`.

### 5.3.2.25 uvTaskManager()

```
void uvTaskManager (
    void * args )
```

The big papa task that deals with handling all of the others.

The responsibilities of this task are as follows:

- Monitor tasks to ensure they are on schedule
- Setup inter-task communication channels
- Invoke SCD if necessary
- Track mem usage if needed

This task is one of the most important ones in the system. Lovely times for all. Therefore it is of utmost importance that this one DOES NOT CRASH. EVER. Wait for incoming instructions from tasks

Definition at line 1042 of file `uvfr_state_engine.c`.

Referenced by `uvStartStateMachine()`.

#### 5.3.2.26 uvValidateManagedTasks()

```
uv_status uvValidateManagedTasks ( )
```

ensure that all the tasks people have created actually make sense, and are valid

Definition at line 346 of file uvfr\_state\_engine.c.

References `_next_task_id`, `_uvValidateSpecificTask()`, and `UV_OK`.

Referenced by `uvStartStateMachine()`.

## 5.4 UVFR Utilities

Module containing useful functions and abstractions that are used throughout the vehicle software system.

### Modules

- [Utility Macros](#)

*handy macros that perform very common functionality*

### 5.4.1 Detailed Description

Module containing useful functions and abstractions that are used throughout the vehicle software system.

This contains several abstractions such as useful macros, global typedefs, memory allocation, etc...

## 5.5 Utility Macros

handy macros that perform very common functionality

### Macros

- `#define _BV(x) _BV_16(x)`
- `#define _BV_8(x) ((uint8_t)(0x01U >> x))`
- `#define _BV_16(x) ((uint16_t)(0x01U >> x))`
- `#define _BV_32(x) ((uint32_t)(0x01U >> x))`
- `#define endianSwap(x) endianSwap16(x)`
- `#define endianSwap8(x) x`
- `#define endianSwap16(x) (((x & 0x00FF)<<8) | ((x & 0xFF00)>>8))`
- `#define endianSwap32(x) (((x & 0x000000FF)<<16)|((x & 0x0000FF00)<<8)|((x & 0x00FF0000)>>8)|((x & 0xFF000000)>>16))`
- `#define deserializeSmallE16(x, i) ((x[i])|(x[i+1]<<8))`
- `#define deserializeSmallE32(x, i) ((x[i])|(x[i+1]<<8)|(x[i+2]<<16)|(x[i+3]<<24))`
- `#define deserializeBigE16(x, i) ((x[i]<<8)|(x[i+1]))`
- `#define deserializeBigE32(x, i) ((x[i]<<24)|(x[i+1]<<16)|(x[i+2]<<8)|(x[i+3]))`
- `#define serializeSmallE16(x, d, i) x[i]=d&0x00FF; x[i+1]=(d&0xFF00)>>8`
- `#define serializeSmallE32(x, d, i) x[i]=d&0x000000FF; x[i+1]=(d&0x0000FF00)>>8; x[i+2]=(d&0x00FF0000)>>16; x[i+3]=(d&0xFF000000)>>24`
- `#define serializeBigE16(x, d, i) x[i+1]=d&0x00FF; x[i]=(d&0xFF00)>>8`
- `#define serializeBigE32(x, d, i) x[i+3]=d&0x000000FF; x[i+2]=(d&0x0000FF00)>>8; x[i+1]=(d&0x00FF0000)>>16; x[i]=(d&0xFF000000)>>24`

    d,  
    i ) x[i+1]=d&0x00FF; x[i]=(d&0xFF00)>>8
```

Definition at line 86 of file uvfr\_utils.h.

### 5.5.2.18 serializeBigE32

```
#define serializeBigE32(  
    x,  
    d,  
    i ) x[i+3]=d&0x000000FF; x[i+2]=(d&0x0000FF00)>>8; x[i+1]=(d&0x00FF0000)>>16;  
x[i]=(d&0xFF000000)>>24
```

Definition at line 87 of file uvfr\_utils.h.

### 5.5.2.19 serializeSmallE16

```
#define serializeSmallE16(  
    x,  
    d,  
    i ) x[i]=d&0x00FF; x[i+1]=(d&0xFF00)>>8
```

Definition at line 84 of file uvfr\_utils.h.

### 5.5.2.20 serializeSmallE32

```
#define serializeSmallE32(  
    x,  
    d,  
    i ) x[i]=d&0x000000FF; x[i+1]=(d&0x0000FF00)>>8; x[i+2]=(d&0x00FF0000)>>16;  
x[i+3]=(d&0xFF000000)>>24
```

Definition at line 85 of file uvfr\_utils.h.

### 5.5.2.21 setBits

```
#define setBits(  
    x,  
    msk,  
    data ) x=(x&(~msk)|data)
```

macro to set bits of an int without touching the ones we dont want to edit

Usage: Will set the values of certain bits of an int. This depends on the following however:

## Parameters

<i>x</i>	represents the value you want to edit. Can be any signed or unsigned integer type.
<i>msk</i>	Bits of X will only be altered if the matching bit of msk is a 1
<i>data</i>	Bits of data will map to bits of x, provided that the corresponding bit of msk is a one

In practice this looks like the following:

```
uint8_t num = 0xF0; // int is 0b11110000
uint8_t mask = 0x22; // msk is 0b00100010
uint8_t data = 0x0F; // val is 0b00001111
//now we deploy the macro
setBits(num,mask,data);
//now, num = 0b11010010
```

Definition at line 112 of file uvfr\_utils.h.

### 5.5.2.22 true

```
#define true !false
```

Definition at line 128 of file uvfr\_utils.h.

## 5.6 UVFR Vehicle Commands

A fun lil API which is used to get the vehicle to do stuff.

A fun lil API which is used to get the vehicle to do stuff.

This is designed to be portable between different versions of the VCU and PMU

## 5.7 UVFR CANbus API

This is an api that simplifies usage of CANbus transmitting and receiving.

### Functions

- void [insertCANMessageHandler](#) (uint32\_t id, void \*handlerfunc)  
*Function to insert an id and function into the lookup table of callback functions.*
- [uv\\_status uvSendCanMSG](#) ([uv\\_CAN\\_msg](#) \*tx\_msg)  
*Function to send CAN message.*

### 5.7.1 Detailed Description

This is an api that simplifies usage of CANbus transmitting and receiving.

### 5.7.2 Function Documentation

#### 5.7.2.1 insertCANMessageHandler()

```
void insertCANMessageHandler (
    uint32_t id,
    void * handlerfunc )
```

Function to insert an id and function into the lookup table of callback functions.

Checks if specific hash id already exists in the hash table. If not, insert the message. If it already exists, check to see if the actual CAN id matches. If yes, then previous entries are overwritten. If it does not exist, then each node in the hash table functions as its own linked list.

Definition at line 395 of file can.c.

References [callback\\_table\\_mutex](#), [CAN\\_callback\\_table](#), [CAN\\_Callback::CAN\\_id](#), [CAN\\_Callback::function](#), [generateHash\(\)](#), and [CAN\\_Callback::next](#).

Referenced by [tempMonitorTask\(\)](#).

#### 5.7.2.2 uvSendCanMSG()

```
uv_status uvSendCanMSG (
    uv_CAN_msg * tx_msg )
```

Function to send CAN message.

This function is the canonical team method of sending a CAN message. It invokes the canTxDaemon, to avoid any conflicts due to a context switch mid transmission. Is it a little bit convoluted? Yes. Is that worth it? Still yes.

Definition at line 513 of file can.c.

References [\\_\\_uvCANtxCriticalSection\(\)](#), [Tx\\_msg\\_queue](#), [UV\\_ERROR](#), and [UV\\_OK](#).

Referenced by [tempMonitorTask\(\)](#), and [testfunc2\(\)](#).

const uint8_t APBPrescTable[8] = {0, 0, 0, 0, 1, 2, 3, 4}
```

Definition at line 139 of file `system_stm32f4xx.c`.

##### 5.14.2.3 SystemCoreClock

```
uint32_t SystemCoreClock = 16000000
```

Definition at line 137 of file `system_stm32f4xx.c`.

Referenced by `SystemCoreClockUpdate()`.

## 5.15 STM32F4xx\_System\_Private\_FunctionPrototypes

## 5.16 STM32F4xx\_System\_Private\_Functions

### Functions

- void [SystemInit](#) (void)  
*Setup the microcontroller system Initialize the FPU setting, vector table location and External memory configuration.*
- void [SystemCoreClockUpdate](#) (void)  
*Update SystemCoreClock variable according to Clock Register Values. The SystemCoreClock variable contains the core clock (HCLK), it can be used by the user application to setup the SysTick timer or configure other parameters.*

#### 5.16.1 Detailed Description

#### 5.16.2 Function Documentation

##### 5.16.2.1 SystemCoreClockUpdate()

```
void SystemCoreClockUpdate (
    void )
```

Update SystemCoreClock variable according to Clock Register Values. The SystemCoreClock variable contains the core clock (HCLK), it can be used by the user application to setup the SysTick timer or configure other parameters.

##### Note

Each time the core clock (HCLK) changes, this function must be called to update SystemCoreClock variable value. Otherwise, any configuration based on this variable will be incorrect.

- The system frequency computed by this function is not the real frequency in the chip. It is calculated based on the predefined constant and the selected clock source:

- If SYSCLK source is HSI, SystemCoreClock will contain the [HSI\\_VALUE\(\\*\)](#)
- If SYSCLK source is HSE, SystemCoreClock will contain the [HSE\\_VALUE\(\\*\\*\)](#)
- If SYSCLK source is PLL, SystemCoreClock will contain the [HSE\\_VALUE\(\\*\\*\)](#) or [HSI\\_VALUE\(\\*\)](#) multiplied/divided by the PLL factors.

(\*) HSI\_VALUE is a constant defined in [stm32f4xx\\_hal\\_conf.h](#) file (default value 16 MHz) but the real value may vary depending on the variations in voltage and temperature.

(\*\*) HSE\_VALUE is a constant defined in [stm32f4xx\\_hal\\_conf.h](#) file (its value depends on the application requirements), user has to ensure that HSE\_VALUE is same as the real frequency of the crystal used. Otherwise, this function may have wrong result.

- The result of this function could be not correct when using fractional value for HSE crystal.

Definition at line 216 of file [system\\_stm32f4xx.c](#).

References [AHBPrescTable](#), [HSE\\_VALUE](#), [HSI\\_VALUE](#), and [SystemCoreClock](#).

##### 5.16.2.2 SystemInit()

```
void SystemInit (
    void )
```

Setup the microcontroller system Initialize the FPU setting, vector table location and External memory configuration.

Definition at line 165 of file [system\\_stm32f4xx.c](#).

## Chapter 6

# Data Structure Documentation

### 6.1 access\_control\_info Union Reference

```
#include <uvfr_utils.h>
```

#### Data Fields

- struct [uv\\_mutex\\_info](#) mutex
- struct [uv\\_binary\\_semaphore\\_info](#) bin\_semaphore
- struct [uv\\_semaphore\\_info](#) semaphore

#### 6.1.1 Detailed Description

Definition at line 254 of file uvfr\_utils.h.

#### 6.1.2 Field Documentation

##### 6.1.2.1 bin\_semaphore

```
struct uv\_binary\_semaphore\_info access_control_info::bin_semaphore
```

Definition at line 256 of file uvfr\_utils.h.

##### 6.1.2.2 mutex

```
struct uv\_mutex\_info access_control_info::mutex
```

Definition at line 255 of file uvfr\_utils.h.

### 6.1.2.3 semaphore

```
struct uv_semaphore_info access_control_info::semaphore
```

Definition at line 257 of file uvfr\_utils.h.

The documentation for this union was generated from the following file:

- Core/Inc/[uvfr\\_utils.h](#)

## 6.2 bms\_settings\_t Struct Reference

```
#include <bms.h>
```

### Data Fields

- uint32\_t [mc\\_CAN\\_timeout](#)

### 6.2.1 Detailed Description

Definition at line 13 of file bms.h.

### 6.2.2 Field Documentation

#### 6.2.2.1 mc\_CAN\_timeout

```
uint32_t bms_settings_t::mc_CAN_timeout
```

Definition at line 14 of file bms.h.

The documentation for this struct was generated from the following file:

- Core/Inc/[bms.h](#)

## 6.3 CAN\_Callback Struct Reference

### Data Fields

- uint32\_t [CAN\\_id](#)
- void \* [function](#)
- struct [CAN\\_Callback](#) \* [next](#)

### 6.3.1 Detailed Description

Definition at line 56 of file can.c.

### 6.3.2 Field Documentation

#### 6.3.2.1 CAN\_id

```
uint32_t CAN_Callback::CAN_id
```

Definition at line 57 of file can.c.

Referenced by `callFunctionFromCANid()`, and `insertCANMessageHandler()`.

#### 6.3.2.2 function

```
void* CAN_Callback::function
```

Definition at line 58 of file can.c.

Referenced by `callFunctionFromCANid()`, and `insertCANMessageHandler()`.

#### 6.3.2.3 next

```
struct CAN_Callback* CAN_Callback::next
```

Definition at line 59 of file can.c.

Referenced by `callFunctionFromCANid()`, `insertCANMessageHandler()`, and `nuke_hash_table()`.

The documentation for this struct was generated from the following file:

- Core/Src/[can.c](#)

## 6.4 daq\_child\_task Struct Reference

```
#include <daq.h>
```

## Data Fields

- struct [rbnode](#) [treenode](#)
- TaskHandle\_t [meta\\_task\\_handle](#)
- [daq\\_param\\_list\\_node](#) \*\* [param\\_list](#)
- uint32\_t [period](#)

### 6.4.1 Detailed Description

Definition at line 70 of file [daq.h](#).

### 6.4.2 Field Documentation

#### 6.4.2.1 meta\_task\_handle

```
TaskHandle_t daq_child_task::meta_task_handle
```

Definition at line 72 of file [daq.h](#).

#### 6.4.2.2 param\_list

```
daq\_param\_list\_node** daq_child_task::param_list
```

Definition at line 73 of file [daq.h](#).

#### 6.4.2.3 period

```
uint32_t daq_child_task::period
```

Definition at line 74 of file [daq.h](#).

#### 6.4.2.4 treenode

```
struct rbnode daq_child_task::treenode
```

Definition at line 71 of file [daq.h](#).

The documentation for this struct was generated from the following file:

- Core/Inc/[daq.h](#)

## 6.5 daq\_datapoint Struct Reference

This struct holds info of what needs to be logged.

```
#include <daq.h>
```

### Data Fields

- uint16\_t [can\\_id](#)
- uint8\_t [period](#)
- uint8\_t [type](#)

### 6.5.1 Detailed Description

This struct holds info of what needs to be logged.

Definition at line 56 of file daq.h.

### 6.5.2 Field Documentation

#### 6.5.2.1 can\_id

```
uint16_t daq_datapoint::can_id
```

Definition at line 57 of file daq.h.

#### 6.5.2.2 period

```
uint8_t daq_datapoint::period
```

Definition at line 58 of file daq.h.

#### 6.5.2.3 type

```
uint8_t daq_datapoint::type
```

Definition at line 59 of file daq.h.

The documentation for this struct was generated from the following file:

- Core/Inc/[daq.h](#)

## 6.6 daq\_loop\_args Struct Reference

```
#include <daq.h>
```

### Data Fields

- `uint8_t throttle_daq_to_preserve_performance`
- `uint8_t minimum_daq_period`
- `uint16_t padding`
- `uint32_t padding2`
- `daq_datapoint datapoints` [`MAX_LOGGABLE_PARAMS`]

### 6.6.1 Detailed Description

Definition at line 62 of file daq.h.

### 6.6.2 Field Documentation

#### 6.6.2.1 datapoints

```
daq_datapoint daq_loop_args::datapoints[MAX_LOGGABLE_PARAMS]
```

Definition at line 67 of file daq.h.

#### 6.6.2.2 minimum\_daq\_period

```
uint8_t daq_loop_args::minimum_daq_period
```

Definition at line 64 of file daq.h.

#### 6.6.2.3 padding

```
uint16_t daq_loop_args::padding
```

Definition at line 65 of file daq.h.

#### 6.6.2.4 padding2

```
uint32_t daq_loop_args::padding2
```

Definition at line 66 of file daq.h.

#### 6.6.2.5 throttle\_daq\_to\_preserve\_performance

```
uint8_t daq_loop_args::throttle_daq_to_preserve_performance
```

Definition at line 63 of file daq.h.

The documentation for this struct was generated from the following file:

- Core/Inc/[daq.h](#)

## 6.7 daq\_param\_list\_node Struct Reference

```
#include <daq.h>
```

### Data Fields

- uint16\_t [param\\_idx](#)
- struct [daq\\_param\\_list\\_node](#) \* [next](#)

### 6.7.1 Detailed Description

Definition at line 48 of file daq.h.

### 6.7.2 Field Documentation

#### 6.7.2.1 next

```
struct daq\_param\_list\_node* daq_param_list_node::next
```

Definition at line 50 of file daq.h.

### 6.7.2.2 param\_idx

```
uint16_t daq_param_list_node::param_idx
```

Definition at line 49 of file daq.h.

The documentation for this struct was generated from the following file:

- Core/Inc/[daq.h](#)

## 6.8 driving\_loop\_args Struct Reference

```
#include <driving_loop.h>
```

### Data Fields

- uint32\_t [absolute\\_max\\_acc\\_pwr](#)
- uint32\_t [absolute\\_max\\_motor\\_torque](#)
- uint32\_t [absolute\\_max\\_accum\\_current](#)
- uint32\_t [max\\_accum\\_current\\_5s](#)
- uint16\_t [absolute\\_max\\_motor\\_rpm](#)
- uint16\_t [regen\\_rpm\\_cutoff](#)
- uint16\_t [min\\_apps\\_offset](#)
- uint16\_t [max\\_apps\\_offset](#)
- uint16\_t [min\\_apps\\_value](#)
- uint16\_t [max\\_apps\\_value](#)
- uint16\_t [min\\_BPS\\_value](#)
- uint16\_t [max\\_BPS\\_value](#)
- uint16\_t [apps\\_top](#)
- uint16\_t [apps\\_bottom](#)
- uint16\_t [apps\\_plausibility\\_check\\_threshold](#)
- uint16\_t [bps\\_plausibility\\_check\\_threshold](#)
- uint16\_t [bps\\_implausibility\\_recovery\\_threshold](#)
- uint16\_t [apps\\_implausibility\\_recovery\\_threshold](#)
- uint8\_t [num\\_driving\\_modes](#)
- uint8\_t [period](#)
- uint8\_t [accum\\_regen\\_soc\\_threshold](#)
- [drivingMode](#) [dmodes](#) [8]

### 6.8.1 Detailed Description

Definition at line 108 of file driving\_loop.h.

### 6.8.2 Field Documentation

### 6.8.2.1 absolute\_max\_acc\_pwr

```
uint32_t driving_loop_args::absolute_max_acc_pwr
```

Maximum possible accum power

Definition at line 109 of file driving\_loop.h.

### 6.8.2.2 absolute\_max\_accum\_current

```
uint32_t driving_loop_args::absolute_max_accum_current
```

Max current (ADC reading)

Definition at line 111 of file driving\_loop.h.

### 6.8.2.3 absolute\_max\_motor\_rpm

```
uint16_t driving_loop_args::absolute_max_motor_rpm
```

Max limit of RPM

Definition at line 115 of file driving\_loop.h.

### 6.8.2.4 absolute\_max\_motor\_torque

```
uint32_t driving_loop_args::absolute_max_motor_torque
```

Max power output

Definition at line 110 of file driving\_loop.h.

### 6.8.2.5 accum\_regen\_soc\_threshold

```
uint8_t driving_loop_args::accum_regen_soc_threshold
```

Vehicle will not regen if above this SOC

Definition at line 138 of file driving\_loop.h.

#### 6.8.2.6 apps\_bottom

```
uint16_t driving_loop_args::apps_bottom
```

Min APPS input value, representing 0% throttle

Definition at line 128 of file driving\_loop.h.

#### 6.8.2.7 apps\_implausibility\_recovery\_threshold

```
uint16_t driving_loop_args::apps_implausibility_recovery_threshold
```

Threshold for brake position

Definition at line 134 of file driving\_loop.h.

#### 6.8.2.8 apps\_plausibility\_check\_threshold

```
uint16_t driving_loop_args::apps_plausibility_check_threshold
```

Threshold for accelerator position with

Definition at line 130 of file driving\_loop.h.

Referenced by StartDrivingLoop().

#### 6.8.2.9 apps\_top

```
uint16_t driving_loop_args::apps_top
```

Max APPS input value, representing 100% throttle

Definition at line 127 of file driving\_loop.h.

#### 6.8.2.10 bps\_implausibility\_recovery\_threshold

```
uint16_t driving_loop_args::bps_implausibility_recovery_threshold
```

Threshold for accellerator pedal position to recover fron APPS check

Definition at line 133 of file driving\_loop.h.

#### 6.8.2.11 bps\_plausibility\_check\_threshold

```
uint16_t driving_loop_args::bps_plausibility_check_threshold
```

Brake pressure threshold for APPS

Definition at line 131 of file driving\_loop.h.

Referenced by StartDrivingLoop().

#### 6.8.2.12 dmodes

```
drivingMode driving_loop_args::dmodes[8]
```

These are various driving modes

Definition at line 141 of file driving\_loop.h.

#### 6.8.2.13 max\_accum\_current\_5s

```
uint32_t driving_loop_args::max_accum_current_5s
```

Current maximum for 10s

Definition at line 112 of file driving\_loop.h.

#### 6.8.2.14 max\_apps\_offset

```
uint16_t driving_loop_args::max_apps_offset
```

maximum APPS offset

Definition at line 121 of file driving\_loop.h.

Referenced by StartDrivingLoop().

#### 6.8.2.15 max\_apps\_value

```
uint16_t driving_loop_args::max_apps_value
```

for detecting disconnects and short circuits

Definition at line 123 of file driving\_loop.h.

Referenced by StartDrivingLoop().

#### 6.8.2.16 max\_BPS\_value

```
uint16_t driving_loop_args::max_BPS_value
```

are the brakes valid?

Definition at line 125 of file driving\_loop.h.

Referenced by StartDrivingLoop().

#### 6.8.2.17 min\_apps\_offset

```
uint16_t driving_loop_args::min_apps_offset
```

minimum APPS offset

Definition at line 120 of file driving\_loop.h.

#### 6.8.2.18 min\_apps\_value

```
uint16_t driving_loop_args::min_apps_value
```

for detecting disconnects and short circuits

Definition at line 122 of file driving\_loop.h.

#### 6.8.2.19 min\_BPS\_value

```
uint16_t driving_loop_args::min_BPS_value
```

are the brakes valid?

Definition at line 124 of file driving\_loop.h.

#### 6.8.2.20 num\_driving\_modes

```
uint8_t driving_loop_args::num_driving_modes
```

How many modes are actually populated

Definition at line 136 of file driving\_loop.h.

### 6.8.2.21 period

```
uint8_t driving_loop_args::period
```

how often does the driving loop execute

Definition at line 137 of file driving\_loop.h.

### 6.8.2.22 regen\_rpm\_cutoff

```
uint16_t driving_loop_args::regen_rpm_cutoff
```

No regen below this rpm

Definition at line 116 of file driving\_loop.h.

The documentation for this struct was generated from the following file:

- Core/Inc/[driving\\_loop.h](#)

## 6.9 drivingLoopArgs Struct Reference

Arguments for the driving loop. The reason this is a struct passed in as an argument, rather than a bunch of global variables or constants is to allow the code to take settings from flash memory, therefore allowing the team to meet it's goal of having an actual GUI to change vehicle settings.

```
#include <driving_loop.h>
```

### 6.9.1 Detailed Description

Arguments for the driving loop. The reason this is a struct passed in as an argument, rather than a bunch of global variables or constants is to allow the code to take settings from flash memory, therefore allowing the team to meet it's goal of having an actual GUI to change vehicle settings.

The documentation for this struct was generated from the following file:

- Core/Inc/[driving\\_loop.h](#)

## 6.10 drivingMode Struct Reference

This is where the driving mode and the [drivingModeParams](#) are at.

```
#include <driving_loop.h>
```

## Data Fields

- char [dm\\_name](#) [16]
- uint32\_t [max\\_acc\\_pwr](#)
- uint32\_t [max\\_motor\\_torque](#)
- uint32\_t [max\\_current](#)
- uint16\_t [flags](#)
- [drivingModeParams](#) [map\\_fn\\_params](#)
- uint8\_t [control\\_map\\_fn](#)

### 6.10.1 Detailed Description

This is where the driving mode and the [drivingModeParams](#) are at.

Definition at line 85 of file [driving\\_loop.h](#).

### 6.10.2 Field Documentation

#### 6.10.2.1 control\_map\_fn

```
uint8_t drivingMode::control_map_fn
```

Definition at line 95 of file [driving\\_loop.h](#).

#### 6.10.2.2 dm\_name

```
char drivingMode::dm_name[16]
```

Name of mode, 15 chars + /0

Definition at line 86 of file [driving\\_loop.h](#).

#### 6.10.2.3 flags

```
uint16_t drivingMode::flags
```

Definition at line 92 of file [driving\\_loop.h](#).

#### 6.10.2.4 map\_fn\_params

```
drivingModeParams drivingMode::map_fn_params
```

Definition at line 94 of file driving\_loop.h.

#### 6.10.2.5 max\_acc\_pwr

```
uint32_t drivingMode::max_acc_pwr
```

Definition at line 87 of file driving\_loop.h.

#### 6.10.2.6 max\_current

```
uint32_t drivingMode::max_current
```

Definition at line 89 of file driving\_loop.h.

#### 6.10.2.7 max\_motor\_torque

```
uint32_t drivingMode::max_motor_torque
```

Definition at line 88 of file driving\_loop.h.

The documentation for this struct was generated from the following file:

- Core/Inc/[driving\\_loop.h](#)

## 6.11 drivingModeParams Union Reference

this struct is designed to hold information about each drivingmode's map params

```
#include <driving_loop.h>
```

### 6.11.1 Detailed Description

this struct is designed to hold information about each drivingmode's map params

Definition at line 75 of file driving\_loop.h.

The documentation for this union was generated from the following file:

- Core/Inc/[driving\\_loop.h](#)

## 6.12 exp\_torque\_map\_args Struct Reference

struct to hold parameters used in an exponential torque map

```
#include <driving_loop.h>
```

### Data Fields

- `int32_t` [offset](#)
- `float` [gamma](#)

### 6.12.1 Detailed Description

struct to hold parameters used in an exponential torque map

Definition at line 56 of file `driving_loop.h`.

### 6.12.2 Field Documentation

#### 6.12.2.1 gamma

```
float exp_torque_map_args::gamma
```

Definition at line 58 of file `driving_loop.h`.

#### 6.12.2.2 offset

```
int32_t exp_torque_map_args::offset
```

Definition at line 57 of file `driving_loop.h`.

The documentation for this struct was generated from the following file:

- `Core/Inc/`[driving\\_loop.h](#)

## 6.13 linear\_torque\_map\_args Struct Reference

```
#include <driving_loop.h>
```

## Data Fields

- `int32_t` [offset](#)
- `float` [slope](#)

### 6.13.1 Detailed Description

Definition at line 48 of file `driving_loop.h`.

### 6.13.2 Field Documentation

#### 6.13.2.1 offset

```
int32_t linear_torque_map_args::offset
```

Definition at line 49 of file `driving_loop.h`.

#### 6.13.2.2 slope

```
float linear_torque_map_args::slope
```

Definition at line 50 of file `driving_loop.h`.

The documentation for this struct was generated from the following file:

- `Core/Inc/driving_loop.h`

## 6.14 motor\_controllor\_settings Struct Reference

```
#include <motor_controller.h>
```

## Data Fields

- `uint32_t` [can\\_id\\_tx](#)
- `uint32_t` [can\\_id\\_rx](#)
- `uint32_t` [mc\\_CAN\\_timeout](#)
- `uint8_t` [proportional\\_gain](#)
- `uint32_t` [integral\\_time\\_constant](#)
- `uint8_t` [integral\\_memory\\_max](#)

### 6.14.1 Detailed Description

Definition at line 150 of file motor\_controller.h.

### 6.14.2 Field Documentation

#### 6.14.2.1 can\_id\_rx

```
uint32_t motor_controllor_settings::can_id_rx
```

Definition at line 154 of file motor\_controller.h.

#### 6.14.2.2 can\_id\_tx

```
uint32_t motor_controllor_settings::can_id_tx
```

Definition at line 152 of file motor\_controller.h.

Referenced by MC\_Request\_Data(), and MotorControllerSpinTest().

#### 6.14.2.3 integral\_memory\_max

```
uint8_t motor_controllor_settings::integral_memory_max
```

Definition at line 163 of file motor\_controller.h.

#### 6.14.2.4 integral\_time\_constant

```
uint32_t motor_controllor_settings::integral_time_constant
```

Definition at line 161 of file motor\_controller.h.

#### 6.14.2.5 mc\_CAN\_timeout

```
uint32_t motor_controllor_settings::mc_CAN_timeout
```

Definition at line 156 of file motor\_controller.h.

#### 6.14.2.6 proportional\_gain

```
uint8_t motor_controllor_settings::proportional_gain
```

Definition at line 159 of file motor\_controller.h.

The documentation for this struct was generated from the following file:

- Core/Inc/[motor\\_controller.h](#)

## 6.15 p\_status Struct Reference

```
#include <uvfr_utils.h>
```

### Data Fields

- [uv\\_status](#) [peripheral\\_status](#)
- TickType\_t [activation\\_time](#)

### 6.15.1 Detailed Description

Definition at line 317 of file uvfr\_utils.h.

### 6.15.2 Field Documentation

#### 6.15.2.1 activation\_time

```
TickType_t p_status::activation_time
```

Definition at line 319 of file uvfr\_utils.h.

#### 6.15.2.2 peripheral\_status

```
uv\_status p_status::peripheral_status
```

Definition at line 318 of file uvfr\_utils.h.

The documentation for this struct was generated from the following file:

- Core/Inc/[uvfr\\_utils.h](#)

## 6.16 rbnode Struct Reference

Node of a Red-Black binary search tree.

```
#include <rb_tree.h>
```

### Data Fields

- struct [rbnode](#) \* [left](#)
- struct [rbnode](#) \* [right](#)
- struct [rbnode](#) \* [parent](#)
- void \* [data](#)
- char [color](#)

### 6.16.1 Detailed Description

Node of a Red-Black binary search tree.

Definition at line 27 of file `rb_tree.h`.

### 6.16.2 Field Documentation

#### 6.16.2.1 color

```
char rbnode::color
```

The color of the node (internal use only)

Definition at line 32 of file `rb_tree.h`.

Referenced by `checkBlackHeight()`, `deleteRepair()`, `insertRepair()`, `print()`, `rbCreate()`, `rbDelete()`, and `rbInsert()`.

#### 6.16.2.2 data

```
void* rbnode::data
```

Pointer to some data contained by the tree

Definition at line 31 of file `rb_tree.h`.

Referenced by `checkOrder()`, `destroyAllNodes()`, `print()`, `rb_apply()`, `rbCreate()`, `rbDelete()`, `rbFind()`, and `rbInsert()`.

### 6.16.2.3 left

```
struct rbnode* rbnode::left
```

Left sub-tree

Definition at line 28 of file `rb_tree.h`.

Referenced by `checkBlackHeight()`, `checkOrder()`, `deleteRepair()`, `destroyAllNodes()`, `insertRepair()`, `print()`, `rb_↔  
apply()`, `rbCreate()`, `rbDelete()`, `rbFind()`, `rbInsert()`, `rbSuccessor()`, `rotateLeft()`, and `rotateRight()`.

### 6.16.2.4 parent

```
struct rbnode* rbnode::parent
```

Parent of node

Definition at line 30 of file `rb_tree.h`.

Referenced by `checkBlackHeight()`, `deleteRepair()`, `destroyAllNodes()`, `insertRepair()`, `rbCreate()`, `rbDelete()`, `rb_↔  
Insert()`, `rbSuccessor()`, `rotateLeft()`, and `rotateRight()`.

### 6.16.2.5 right

```
struct rbnode* rbnode::right
```

Right sub-tree

Definition at line 29 of file `rb_tree.h`.

Referenced by `checkBlackHeight()`, `checkOrder()`, `deleteRepair()`, `destroyAllNodes()`, `insertRepair()`, `print()`, `rb_↔  
apply()`, `rbCreate()`, `rbDelete()`, `rbFind()`, `rbInsert()`, `rbSuccessor()`, `rotateLeft()`, and `rotateRight()`.

The documentation for this struct was generated from the following file:

- `Core/Inc/rb\_tree.h`

## 6.17 rbtree Struct Reference

struct representing a binary search tree

```
#include <rb_tree.h>
```

## Data Fields

- `int(* compare )(const void *, const void *)`
- `void(* print )(void *)`
- `void(* destroy )(void *)`
- `rbnode root`
- `rbnode nil`
- `rbnode * min`
- `int count`

### 6.17.1 Detailed Description

struct representing a binary search tree

Definition at line 39 of file `rb_tree.h`.

### 6.17.2 Field Documentation

#### 6.17.2.1 compare

```
int(* rbtree::compare) (const void *, const void *)
```

Function to compare between two different nodes

Definition at line 40 of file `rb_tree.h`.

Referenced by `checkOrder()`, `rbCreate()`, `rbFind()`, and `rbInsert()`.

#### 6.17.2.2 count

```
int rbtree::count
```

number of items stored in the tree

Definition at line 53 of file `rb_tree.h`.

Referenced by `destroyAllNodes()`, `rbCreate()`, `rbDelete()`, and `rbInsert()`.

### 6.17.2.3 destroy

```
void(* rbtree::destroy) (void *)
```

Destructor function for whatever data is stored in the tree

Definition at line 42 of file rb\_tree.h.

Referenced by destroyAllNodes(), rbCreate(), rbDelete(), and rbInsert().

### 6.17.2.4 min

```
rbnode* rbtree::min
```

Pointer to minimum element

Definition at line 50 of file rb\_tree.h.

Referenced by rbCreate(), rbDelete(), and rbInsert().

### 6.17.2.5 nil

```
rbnode rbtree::nil
```

The "NIL" node of the tree, used to avoid fucked null errors

Definition at line 45 of file rb\_tree.h.

Referenced by rbCreate().

### 6.17.2.6 print

```
void(* rbtree::print) (void *)
```

For printing purposes. NOT YET IMPLEMENTED ON ANY SYSTEMS IN THE CAR

Definition at line 41 of file rb\_tree.h.

### 6.17.2.7 root

```
rbnode rbtree::root
```

Root of actual tree

Definition at line 44 of file rb\_tree.h.

Referenced by rbCreate().

The documentation for this struct was generated from the following file:

- Core/Inc/[rb\\_tree.h](#)

## 6.18 s\_curve\_torque\_map\_args Struct Reference

struct for s-curve parameters for torque

```
#include <driving_loop.h>
```

### Data Fields

- int32\_t [a](#)
- int32\_t [b](#)
- int32\_t [c](#) [16]

### 6.18.1 Detailed Description

struct for s-curve parameters for torque

Definition at line 66 of file driving\_loop.h.

### 6.18.2 Field Documentation

#### 6.18.2.1 a

```
int32_t s_curve_torque_map_args::a
```

Definition at line 67 of file driving\_loop.h.

### 6.18.2.2 b

```
int32_t s_curve_torque_map_args::b
```

Definition at line 68 of file `driving_loop.h`.

### 6.18.2.3 c

```
int32_t s_curve_torque_map_args::c[16]
```

Definition at line 69 of file `driving_loop.h`.

The documentation for this struct was generated from the following file:

- [Core/Inc/driving\\_loop.h](#)

## 6.19 state\_change\_daemon\_args Struct Reference

### Data Fields

- `TaskHandle_t` [meta\\_task\\_handle](#)

### 6.19.1 Detailed Description

Definition at line 61 of file `uvfr_state_engine.c`.

### 6.19.2 Field Documentation

#### 6.19.2.1 meta\_task\_handle

```
TaskHandle_t state_change_daemon_args::meta_task_handle
```

Definition at line 62 of file `uvfr_state_engine.c`.

Referenced by `changeVehicleState()`.

The documentation for this struct was generated from the following file:

- [Core/Src/uvfr\\_state\\_engine.c](#)

## 6.20 task\_management\_info Struct Reference

Struct to contain data about a parent task.

```
#include <uvfr_state_engine.h>
```

### Data Fields

- TaskHandle\_t [task\\_handle](#)
- QueueHandle\_t [parent\\_msg\\_queue](#)

### 6.20.1 Detailed Description

Struct to contain data about a parent task.

This contains the information required for the child task to communicate with it's parent.

This will be a queue, since one parent task can in theory have several child tasks

Definition at line 154 of file uvfr\_state\_engine.h.

### 6.20.2 Field Documentation

#### 6.20.2.1 parent\_msg\_queue

```
QueueHandle_t task_management_info::parent_msg_queue
```

Definition at line 156 of file uvfr\_state\_engine.h.

#### 6.20.2.2 task\_handle

```
TaskHandle_t task_management_info::task_handle
```

Actual handle of parent

Definition at line 155 of file uvfr\_state\_engine.h.

Referenced by uvSVCTaskManager().

The documentation for this struct was generated from the following file:

- Core/Inc/[uvfr\\_state\\_engine.h](#)

## 6.21 task\_status\_block Struct Reference

Information about the task.

```
#include <uvfr_state_engine.h>
```

### Data Fields

- uint32\_t [task\\_high\\_water\\_mark](#)
- TickType\_t [task\\_report\\_time](#)

#### 6.21.1 Detailed Description

Information about the task.

Definition at line 162 of file uvfr\_state\_engine.h.

#### 6.21.2 Field Documentation

##### 6.21.2.1 task\_high\_water\_mark

```
uint32_t task_status_block::task_high_water_mark
```

Definition at line 163 of file uvfr\_state\_engine.h.

##### 6.21.2.2 task\_report\_time

```
TickType_t task_status_block::task_report_time
```

Definition at line 164 of file uvfr\_state\_engine.h.

The documentation for this struct was generated from the following file:

- Core/Inc/[uvfr\\_state\\_engine.h](#)

## 6.22 uv\_binary\_semaphore\_info Struct Reference

```
#include <uvfr_utils.h>
```

## Data Fields

- SemaphoreHandle\_t [handle](#)

### 6.22.1 Detailed Description

Definition at line 244 of file uvfr\_utils.h.

### 6.22.2 Field Documentation

#### 6.22.2.1 handle

```
SemaphoreHandle_t uv_binary_semaphore_info::handle
```

Definition at line 245 of file uvfr\_utils.h.

The documentation for this struct was generated from the following file:

- Core/Inc/[uvfr\\_utils.h](#)

## 6.23 uv\_CAN\_msg Struct Reference

Representative of a CAN message.

```
#include <uvfr_utils.h>
```

## Data Fields

- uint8\_t [flags](#)
- uint8\_t [dlc](#)
- uint32\_t [msg\\_id](#)
- uint8\_t [data](#) [8]

### 6.23.1 Detailed Description

Representative of a CAN message.

Definition at line 270 of file uvfr\_utils.h.

### 6.23.2 Field Documentation

### 6.23.2.1 data

```
uint8_t uv_CAN_msg::data[8]
```

The actual data packet contained within the CAN message

Definition at line 277 of file uvfr\_utils.h.

Referenced by `__uvCANtxCritSection()`, `CANbusTxSvcDaemon()`, `HAL_CAN_RxFifo0MsgPendingCallback()`, `tempMonitorTask()`, and `testfunc2()`.

### 6.23.2.2 dlc

```
uint8_t uv_CAN_msg::dlc
```

Data Length Code, representing how many bytes of data are present

Definition at line 275 of file uvfr\_utils.h.

Referenced by `__uvCANtxCritSection()`, `CANbusTxSvcDaemon()`, `HAL_CAN_RxFifo0MsgPendingCallback()`, and `tempMonitorTask()`.

### 6.23.2.3 flags

```
uint8_t uv_CAN_msg::flags
```

Bitfield that contains some basic information about the message: -Bit 0: Is the message an extended ID message, or a standard ID message? 1 For extended. -Bits 1:2 Which CANbus is being used to send the message? 01 -> CAN1 10 -> CAN2 11 -> CAN3 (doesn't exist yet). Will default to CAN

## 6.24 uv\_init\_struct Struct Reference

```
#include <uvfr_utils.h>
```

### Data Fields

- [bool use\\_default\\_settings](#)

### 6.24.1 Detailed Description

contains info relevant to initializing the vehicle

Definition at line 284 of file uvfr\_utils.h.

### 6.24.2 Field Documentation

#### 6.24.2.1 use\_default\_settings

```
bool uv_init_struct::use_default_settings
```

Definition at line 285 of file uvfr\_utils.h.

Referenced by MX\_FREERTOS\_Init().

The documentation for this struct was generated from the following file:

- Core/Inc/[uvfr\\_utils.h](#)

## 6.25 uv\_init\_task\_args Struct Reference

Struct designed to act like the [uv\\_task\\_info](#) struct, but for the initialisation tasks. As a result it takes fewer arguments.

```
#include <uvfr_utils.h>
```

### Data Fields

- void \* [specific\\_args](#)
- QueueHandle\_t [init\\_info\\_queue](#)
- TaskHandle\_t [meta\\_task\\_handle](#)

### 6.25.1 Detailed Description

Struct designed to act like the [uv\\_task\\_info](#) struct, but for the initialisation tasks. As a result it takes fewer arguments.

Definition at line 329 of file [uvfr\\_utils.h](#).

### 6.25.2 Field Documentation

#### 6.25.2.1 init\_info\_queue

```
QueueHandle_t uv_init_task_args::init_info_queue
```

Definition at line 331 of file [uvfr\\_utils.h](#).

Referenced by [BMS\\_Init\(\)](#), [initIMD\(\)](#), [initPDU\(\)](#), [MC\\_Startup\(\)](#), and [uvInit\(\)](#).

#### 6.25.2.2 meta\_task\_handle

```
TaskHandle_t uv_init_task_args::meta_task_handle
```

Definition at line 332 of file [uvfr\\_utils.h](#).

Referenced by [BMS\\_Init\(\)](#), [initIMD\(\)](#), [initPDU\(\)](#), [MC\\_Startup\(\)](#), and [uvInit\(\)](#).

#### 6.25.2.3 specific\_args

```
void* uv_init_task_args::specific_args
```

Definition at line 330 of file [uvfr\\_utils.h](#).

Referenced by [MC\\_Startup\(\)](#), and [uvInit\(\)](#).

The documentation for this struct was generated from the following file:

- [Core/Inc/uvfr\\_utils.h](#)

## 6.26 uv\_init\_task\_response Struct Reference

Struct representing the response of one of the initialization tasks.

```
#include <uvfr_utils.h>
```

## Data Fields

- [uv\\_status](#) status
- [uv\\_ext\\_device\\_id](#) device
- [uint8\\_t](#) nchar
- [char \\*](#) [errmsg](#)

### 6.26.1 Detailed Description

Struct representing the response of one of the initialization tasks.

Is returned in the initialization queue, and is read by [uvInit\(\)](#) to determine whether the initialization of the internal device has failed or succeeded.

Definition at line 355 of file [uvfr\\_utils.h](#).

### 6.26.2 Field Documentation

#### 6.26.2.1 device

```
uv\_ext\_device\_id uv_init_task_response::device
```

Definition at line 357 of file [uvfr\\_utils.h](#).

Referenced by [uvInit\(\)](#).

#### 6.26.2.2 errmsg

```
char* uv_init_task_response::errmsg
```

Definition at line 359 of file [uvfr\\_utils.h](#).

Referenced by [uvInit\(\)](#).

#### 6.26.2.3 nchar

```
uint8_t uv_init_task_response::nchar
```

Definition at line 358 of file [uvfr\\_utils.h](#).

Referenced by [uvInit\(\)](#).

#### 6.26.2.4 status

```
uv_status uv_init_task_response::status
```

Definition at line 356 of file uvfr\_utils.h.

Referenced by uvInit().

The documentation for this struct was generated from the following file:

- Core/Inc/[uvfr\\_utils.h](#)

## 6.27 uv\_internal\_params Struct Reference

Data used by the uvfr\_utils library to do what it needs to do :)

```
#include <uvfr_utils.h>
```

### Data Fields

- [uv\\_init\\_struct](#) \* [init\\_params](#)
- [uv\\_vehicle\\_settings](#) \* [vehicle\\_settings](#)
- [p\\_status](#) [peripheral\\_status](#) [8]
- [uint16\\_t](#) [e\\_code](#) [8]

### 6.27.1 Detailed Description

Data used by the uvfr\_utils library to do what it needs to do :)

This is a global variable that is initialized at some point at launch

Definition at line 341 of file uvfr\_utils.h.

### 6.27.2 Field Documentation

#### 6.27.2.1 e\_code

```
uint16_t uv_internal_params::e_code[8]
```

Definition at line 345 of file uvfr\_utils.h.

### 6.27.2.2 `init_params`

```
uv_init_struct* uv_internal_params::init_params
```

Definition at line 342 of file `uvfr_utils.h`.

### 6.27.2.3 `peripheral_status`

```
p_status uv_internal_params::peripheral_status[8]
```

Definition at line 344 of file `uvfr_utils.h`.

### 6.27.2.4 `vehicle_settings`

```
uv_vehicle_settings* uv_internal_params::vehicle_settings
```

Definition at line 343 of file `uvfr_utils.h`.

The documentation for this struct was generated from the following file:

- Core/Inc/[uvfr\\_utils.h](#)

## 6.28 `uv_mutex_info` Struct Reference

```
#include <uvfr_utils.h>
```

### Data Fields

- SemaphoreHandle\_t [handle](#)

### 6.28.1 Detailed Description

Definition at line 239 of file `uvfr_utils.h`.

### 6.28.2 Field Documentation

### 6.28.2.1 handle

```
SemaphoreHandle_t uv_mutex_info::handle
```

Definition at line 240 of file uvfr\_utils.h.

The documentation for this struct was generated from the following file:

- Core/Inc/[uvfr\\_utils.h](#)

## 6.29 uv\_os\_settings Struct Reference

Settings that dictate state engine behavior.

```
#include <uvfr_state_engine.h>
```

### Data Fields

- TickType\_t [svc\\_task\\_manager\\_period](#)
- TickType\_t [task\\_manager\\_period](#)
- TickType\_t [max\\_svc\\_task\\_period](#)
- TickType\_t [max\\_task\\_period](#)
- TickType\_t [min\\_task\\_period](#)

### 6.29.1 Detailed Description

Settings that dictate state engine behavior.

Definition at line 171 of file uvfr\_state\_engine.h.

### 6.29.2 Field Documentation

#### 6.29.2.1 max\_svc\_task\_period

```
TickType_t uv_os_settings::max_svc_task_period
```

Definition at line 174 of file uvfr\_state\_engine.h.

### 6.29.2.2 max\_task\_period

```
TickType_t uv_os_settings::max_task_period
```

Definition at line 175 of file uvfr\_state\_engine.h.

### 6.29.2.3 min\_task\_period

```
TickType_t uv_os_settings::min_task_period
```

Definition at line 176 of file uvfr\_state\_engine.h.

### 6.29.2.4 svc\_task\_manager\_period

```
TickType_t uv_os_settings::svc_task_manager_period
```

Definition at line 172 of file uvfr\_state\_engine.h.

### 6.29.2.5 task\_manager\_period

```
TickType_t uv_os_settings::task_manager_period
```

Definition at line 173 of file uvfr\_state\_engine.h.

The documentation for this struct was generated from the following file:

- [Core/Inc/uvfr\\_state\\_engine.h](#)

## 6.30 uv\_scd\_response Struct Reference

```
#include <uvfr_state_engine.h>
```

### Data Fields

- enum [uv\\_scd\\_response\\_e](#) response\_val
- [uv\\_task\\_id](#) meta\_id

### 6.30.1 Detailed Description

Definition at line 114 of file uvfr\_state\_engine.h.

## 6.30.2 Field Documentation

### 6.30.2.1 meta\_id

```
uv_task_id uv_scd_response::meta_id
```

Definition at line 116 of file uvfr\_state\_engine.h.

Referenced by \_stateChangeDaemon(), killSelf(), proccessSCDMsg(), and suspendSelf().

### 6.30.2.2 response\_val

```
enum uv_scd_response_e uv_scd_response::response_val
```

Definition at line 115 of file uvfr\_state\_engine.h.

Referenced by killSelf(), proccessSCDMsg(), and suspendSelf().

The documentation for this struct was generated from the following file:

- Core/Inc/[uvfr\\_state\\_engine.h](#)

## 6.31 uv\_semaphore\_info Struct Reference

```
#include <uvfr_utils.h>
```

### Data Fields

- SemaphoreHandle\_t [handle](#)

### 6.31.1 Detailed Description

Definition at line 249 of file uvfr\_utils.h.

### 6.31.2 Field Documentation

### 6.31.2.1 handle

```
SemaphoreHandle_t uv_semaphore_info::handle
```

Definition at line 250 of file uvfr\_utils.h.

The documentation for this struct was generated from the following file:

- [Core/Inc/uvfr\\_utils.h](#)

## 6.32 uv\_task\_info Struct Reference

This struct is designed to hold necessary information about an RTOS task that will be managed by uvfr\_state\_↔ engine.

```
#include <uvfr_state_engine.h>
```

### Data Fields

- [uv\\_task\\_id](#) task\_id
- char \* [task\\_name](#)
- [uv\\_timespan\\_ms](#) task\_period
- [uv\\_timespan\\_ms](#) deletion\_delay
- TaskFunction\_t [task\\_function](#)
- osPriority [task\\_priority](#)
- uint32\_t [stack\\_size](#)
- [uv\\_task\\_status](#) task\_state
- TaskHandle\_t [task\\_handle](#)
- [uv\\_task\\_cmd](#) cmd\_data
- void \* [task\\_args](#)
- struct uv\_task\_info\_t \* [parent](#)
- [task\\_management\\_info](#) \* tmi
- MessageBufferHandle\_t [task\\_rx\\_mailbox](#)
- uint16\_t [active\\_states](#)
- uint16\_t [deletion\\_states](#)
- uint16\_t [suspension\\_states](#)
- uint16\_t [task\\_flags](#)

### 6.32.1 Detailed Description

This struct is designed to hold necessary information about an RTOS task that will be managed by uvfr\_state\_↔ engine.

Pay close attention, because this is one of the most cursed structs in the project, as well as one of the most important

Definition at line 209 of file uvfr\_state\_engine.h.

## 6.32.2 Field Documentation

### 6.32.2.1 active\_states

```
uint16_t uv_task_info::active_states
```

Definition at line 239 of file uvfr\_state\_engine.h.

Referenced by `_stateChangeDaemon()`, `_uvValidateSpecificTask()`, `initDaqTask()`, `initDrivingLoop()`, `initOdometer()`, `initTempMonitor()`, `uvCreateServiceTask()`, `uvCreateTask()`, and `uvSVCTaskManager()`.

### 6.32.2.2 cmd\_data

```
uv_task_cmd uv_task_info::cmd_data
```

how we communicate with the task rn - THIS SUCKS SO BAD

Definition at line 230 of file uvfr\_state\_engine.h.

Referenced by `CANbusRxSvcDaemon()`, `CANbusTxSvcDaemon()`, `daqMasterTask()`, `killSelf()`, `odometerTask()`, `StartDrivingLoop()`, `suspendSelf()`, `tempMonitorTask()`, `uvDeleteSVCTask()`, `uvDeleteTask()`, and `uvSuspendTask()`.

### 6.32.2.3 deletion\_delay

```
uv_timespan_ms uv_task_info::deletion_delay
```

If deferred deletion is enabled, how long to wait before we delete task?

Definition at line 214 of file uvfr\_state\_engine.h.

### 6.32.2.4 deletion\_states

```
uint16_t uv_task_info::deletion_states
```

Definition at line 240 of file uvfr\_state\_engine.h.

Referenced by `_stateChangeDaemon()`, `_uvValidateSpecificTask()`, `initDaqTask()`, `initDrivingLoop()`, `initOdometer()`, `initTempMonitor()`, `uvCreateServiceTask()`, and `uvCreateTask()`.

#### 6.32.2.5 parent

```
struct uv_task_info_t* uv_task_info::parent
```

info about the parent of the task

Definition at line 234 of file uvfr\_state\_engine.h.

Referenced by uvCreateServiceTask(), and uvCreateTask().

#### 6.32.2.6 stack\_size

```
uint32_t uv_task_info::stack_size
```

Number of words allocated to the stack of the task

Definition at line 220 of file uvfr\_state\_engine.h.

Referenced by initDaqTask(), initDrivingLoop(), initOdometer(), initTempMonitor(), uvCreateServiceTask(), uv↔CreateTask(), uvStartStateMachine(), uvStartSVCTask(), and uvStartTask().

#### 6.32.2.7 suspension\_states

```
uint16_t uv_task_info::suspension_states
```

Definition at line 241 of file uvfr\_state\_engine.h.

Referenced by \_stateChangeDaemon(), \_uvValidateSpecificTask(), initDaqTask(), initDrivingLoop(), initOdometer(), initTempMonitor(), uvCreateServiceTask(), and uvCreateTask().

#### 6.32.2.8 task\_args

```
void* uv_task_info::task_args
```

arguments for the specific task, this is where we will likely pass in task settings

Definition at line 232 of file uvfr\_state\_engine.h.

Referenced by initDaqTask(), initDrivingLoop(), initOdometer(), initTempMonitor(), StartDrivingLoop(), and uv↔StartSVCTask().

### 6.32.2.9 task\_flags

uint16\_t uv\_task\_info::task\_flags

- Bits 0:1 - | Task MGMT | Vehicle Application task - 01 | Periodic SVC Task - 10 | Dormant SVC Task - 11
- Bit 2 - Log task start + stop time
- Bit 3 - Log mem usage
- Bit 4 - SCD ignore flag (only use if task is application layer)
- Bit 5 - is parent
- Bit 6 - is child
- Bit 7 - is orphaned
- Bit 8 - error in child task
- Bit 9 - awaiting deferred deletion
- Bit 10 - deferred deletion enabled
- Bits 11:12 - Deadline firmness | No enforcement - 00 | Gradual Priority Incrimmentation - 01 | Firm deadline 10 | Critical Deadline - 11
- Bit 13 - mission critical, if this specific task crashes, the car will not continue to run
- Bit 14 - Task currently delaying, either by vTaskDelay or vTaskDelayUntil

Definition at line 243 of file uvfr\_state\_engine.h.

Referenced by \_stateChangeDaemon(), uvCreateServiceTask(), uvCreateTask(), uvScheduleTaskDeletion(), uv↔StartStateMachine(), uvStartSVCTask(), and uvTaskCrashHandler().

### 6.32.2.10 task\_function

TaskFunction\_t uv\_task\_info::task\_function

Pointer to function that implements the task

Definition at line 216 of file uvfr\_state\_engine.h.

Referenced by \_\_uvValidateSpecificTask(), initDaqTask(), initDrivingLoop(), initOdometer(), initTempMonitor(), uv↔CreateServiceTask(), uvCreateTask(), uvStartStateMachine(), uvStartSVCTask(), uvStartTask(), and uvSVCTask↔Manager().

### 6.32.2.11 task\_handle

```
TaskHandle_t uv_task_info::task_handle
```

Handle of freeRTOS task control block

Definition at line 228 of file uvfr\_state\_engine.h.

Referenced by `_stateChangeDaemon()`, `CANbusRxSvcDaemon()`, `killSelf()`, `processSCDMsg()`, `suspendSelf()`, `uvCreateServiceTask()`, `uvCreateTask()`, `uvDeleteSVCTask()`, `uvDeleteTask()`, `uvStartStateMachine()`, `uvStartSVCTask()`, `uvStartTask()`, and `uvSuspendTask()`.

### 6.32.2.12 task\_id

```
uv_task_id uv_task_info::task_id
```

Detailed description after the member

Definition at line 210 of file uvfr\_state\_engine.h.

Referenced by `killSelf()`, `suspendSelf()`, `uvCreateServiceTask()`, `uvCreateTask()`, `uvDeleteTask()`, `uvScheduleTaskDeletion()`, `uvStartTask()`, and `uvSuspendTask()`.

### 6.32.2.13 task\_name

```
char* uv_task_info::task_name
```

Detailed description after the member

Definition at line 211 of file uvfr\_state\_engine.h.

Referenced by `_uvValidateSpecificTask()`, `compareTaskByName()`, `initDaqTask()`, `initDrivingLoop()`, `initOdometer()`, `initTempMonitor()`, `uvCreateServiceTask()`, `uvCreateTask()`, `uvStartStateMachine()`, `uvStartSVCTask()`, `uvStartTask()`, and `uvSVCTaskManager()`.

### 6.32.2.14 task\_period

```
uv_timespan_ms uv_task_info::task_period
```

Maximum period between task execution

Definition at line 213 of file uvfr\_state\_engine.h.

Referenced by `daqMasterTask()`, `initDaqTask()`, `initDrivingLoop()`, `initOdometer()`, `initTempMonitor()`, `odometerTask()`, `StartDrivingLoop()`, `tempMonitorTask()`, and `uvStartStateMachine()`.

### 6.32.2.15 task\_priority

```
osPriority uv_task_info::task_priority
```

Priority of the task. Int between 0 and 7

Definition at line 217 of file uvfr\_state\_engine.h.

Referenced by `initDaqTask()`, `initDrivingLoop()`, `initOdometer()`, `initTempMonitor()`, `uvCreateServiceTask()`, `uv↔CreateTask()`, `uvStartSVCTask()`, and `uvStartTask()`.

### 6.32.2.16 task\_rx\_mailbox

```
MessageBufferHandle_t uv_task_info::task_rx_mailbox
```

Incoming messages for this task

Definition at line 237 of file uvfr\_state\_engine.h.

### 6.32.2.17 task\_state

```
uv_task_status uv_task_info::task_state
```

Definition at line 225 of file uvfr\_state\_engine.h.

Referenced by `_stateChangeDaemon()`, `killSelf()`, `processSCDMsg()`, `suspendSelf()`, `uvCreateServiceTask()`, `uv↔CreateTask()`, `uvDeleteSVCTask()`, `uvDeleteTask()`, `uvScheduleTaskDeletion()`, `uvStartSVCTask()`, `uvStartTask()`, `uvSuspendSVCTask()`, and `uvSuspendTask()`.

### 6.32.2.18 tmi

```
task_management_info* uv_task_info::tmi
```

how we will be communicating in the future

Definition at line 236 of file uvfr\_state\_engine.h.

The documentation for this struct was generated from the following file:

- [Core/Inc/uvfr\\_state\\_engine.h](#)

## 6.33 uv\_task\_msg\_t Struct Reference

Struct containing a message between two tasks.

```
#include <uvfr_utils.h>
```

## Data Fields

- uint32\_t [message\\_type](#)
- [uv\\_task\\_info](#) \* [sender](#)
- [uv\\_task\\_info](#) \* [intended\\_recipient](#)
- TickType\_t [time\\_sent](#)
- size\_t [message\\_size](#)
- void \* [msg\\_contents](#)

### 6.33.1 Detailed Description

Struct containing a message between two tasks.

This is a generic type that is best used in situations where the message could mean a variety of different things. For niche applications or where efficiency is paramount, we recommend creating a bespoke protocol.

Definition at line 301 of file [uvfr\\_utils.h](#).

### 6.33.2 Field Documentation

#### 6.33.2.1 [intended\\_recipient](#)

```
uv\_task\_info* uv\_task\_msg\_t::intended\_recipient
```

Definition at line 304 of file [uvfr\\_utils.h](#).

#### 6.33.2.2 [message\\_size](#)

```
size_t uv\_task\_msg\_t::message\_size
```

Definition at line 306 of file [uvfr\\_utils.h](#).

#### 6.33.2.3 [message\\_type](#)

```
uint32_t uv\_task\_msg\_t::message\_type
```

Definition at line 302 of file [uvfr\\_utils.h](#).

#### 6.33.2.4 msg\_contents

```
void* uv_task_msg_t::msg_contents
```

Definition at line 307 of file uvfr\_utils.h.

#### 6.33.2.5 sender

```
uv_task_info* uv_task_msg_t::sender
```

Definition at line 303 of file uvfr\_utils.h.

#### 6.33.2.6 time\_sent

```
TickType_t uv_task_msg_t::time_sent
```

Definition at line 305 of file uvfr\_utils.h.

The documentation for this struct was generated from the following file:

- Core/Inc/[uvfr\\_utils.h](#)

## 6.34 uv\_vehicle\_settings Struct Reference

```
#include <uvfr_settings.h>
```

### Data Fields

- struct [uv\\_os\\_settings](#) \* [os\\_settings](#)
- struct [motor\\_controller\\_settings](#) \* [mc\\_settings](#)
- [driving\\_loop\\_args](#) \* [driving\\_loop\\_settings](#)
- void \* [imd\\_settings](#)
- [bms\\_settings\\_t](#) \* [bms\\_settings](#)
- [daq\\_loop\\_args](#) \* [daq\\_settings](#)
- void \* [pdu\\_settings](#)
- uint16\_t [is\\_default](#)

### 6.34.1 Detailed Description

Definition at line 32 of file uvfr\_settings.h.

## 6.34.2 Field Documentation

### 6.34.2.1 bms\_settings

`bms_settings_t*` `uv_vehicle_settings::bms_settings`

Definition at line 40 of file `uvfr_settings.h`.

Referenced by `uvInit()`.

### 6.34.2.2 daq\_settings

`daq_loop_args*` `uv_vehicle_settings::daq_settings`

Definition at line 42 of file `uvfr_settings.h`.

### 6.34.2.3 driving\_loop\_settings

`driving_loop_args*` `uv_vehicle_settings::driving_loop_settings`

Definition at line 37 of file `uvfr_settings.h`.

### 6.34.2.4 imd\_settings

`void*` `uv_vehicle_settings::imd_settings`

Definition at line 39 of file `uvfr_settings.h`.

Referenced by `uvInit()`.

### 6.34.2.5 is\_default

`uint16_t` `uv_vehicle_settings::is_default`

Bitfield containing info on whether each settings instance is factory default. 0 default, 1 altered

Definition at line 47 of file `uvfr_settings.h`.

#### 6.34.2.6 mc\_settings

```
struct motor\_controller\_settings* uv_vehicle_settings::mc_settings
```

Definition at line 35 of file [uvfr\\_settings.h](#).

Referenced by [uvInit\(\)](#).

#### 6.34.2.7 os\_settings

```
struct uv\_os\_settings* uv_vehicle_settings::os_settings
```

Definition at line 34 of file [uvfr\\_settings.h](#).

Referenced by [setupDefaultSettings\(\)](#).

#### 6.34.2.8 pdu\_settings

```
void* uv_vehicle_settings::pdu_settings
```

Definition at line 44 of file [uvfr\\_settings.h](#).

The documentation for this struct was generated from the following file:

- Core/Inc/[uvfr\\_settings.h](#)

## 6.35 veh\_gen\_info Struct Reference

```
#include <uvfr\_settings.h>
```

### 6.35.1 Detailed Description

Definition at line 28 of file [uvfr\\_settings.h](#).

The documentation for this struct was generated from the following file:

- Core/Inc/[uvfr\\_settings.h](#)

## Chapter 7

# File Documentation

### 7.1 Core/Inc/adc.h File Reference

This file contains all the function prototypes for the [adc.c](#) file.

```
#include "main.h"
```

#### Macros

- `#define ADC1_BUF_LEN 40`
- `#define ADC1_CHNL_CNT 4`
- `#define ADC1_SAMPLES 10`
- `#define ADC2_BUF_LEN 2`
- `#define ADC2_CHNL_CNT 2`
- `#define ADC2_SAMPLES 1`
- `#define ADC1_MIN_VOLT 500`
- `#define ADC1_MAX_VOLT 2850`
- `#define ADC2_MIN_VOLT 69`
- `#define ADC2_MAX_VOLT 69`

#### Functions

- void `MX_ADC1_Init` (void)
- void `MX_ADC2_Init` (void)

#### Variables

- ADC\_HandleTypeDef `hadc1`
- ADC\_HandleTypeDef `hadc2`

### 7.1.1 Detailed Description

This file contains all the function prototypes for the [adc.c](#) file.

### 7.1.2 Macro Definition Documentation

#### 7.1.2.1 ADC1\_BUF\_LEN

```
#define ADC1_BUF_LEN 40
```

Definition at line 43 of file adc.h.

#### 7.1.2.2 ADC1\_CHNL\_CNT

```
#define ADC1_CHNL_CNT 4
```

Definition at line 44 of file adc.h.

#### 7.1.2.3 ADC1\_MAX\_VOLT

```
#define ADC1_MAX_VOLT 2850
```

Definition at line 55 of file adc.h.

#### 7.1.2.4 ADC1\_MIN\_VOLT

```
#define ADC1_MIN_VOLT 500
```

Definition at line 54 of file adc.h.

#### 7.1.2.5 ADC1\_SAMPLES

```
#define ADC1_SAMPLES 10
```

Definition at line 45 of file adc.h.

#### 7.1.2.6 ADC2\_BUF\_LEN

```
#define ADC2_BUF_LEN 2
```

Definition at line 48 of file adc.h.

#### 7.1.2.7 ADC2\_CHNL\_CNT

```
#define ADC2_CHNL_CNT 2
```

Definition at line 49 of file adc.h.

#### 7.1.2.8 ADC2\_MAX\_VOLT

```
#define ADC2_MAX_VOLT 69
```

Definition at line 58 of file adc.h.

#### 7.1.2.9 ADC2\_MIN\_VOLT

```
#define ADC2_MIN_VOLT 69
```

Definition at line 57 of file adc.h.

#### 7.1.2.10 ADC2\_SAMPLES

```
#define ADC2_SAMPLES 1
```

Definition at line 50 of file adc.h.

### 7.1.3 Function Documentation

#### 7.1.3.1 MX\_ADC1\_Init()

```
void MX_ADC1_Init (
    void )
```

Configure the global features of the ADC (Clock, Resolution, Data Alignment and number of conversion)

Configure the analog watchdog

Configure for the selected ADC regular channel its corresponding rank in the sequencer and its sample time.

Configure for the selected ADC regular channel its corresponding rank in the sequencer and its sample time.

Configure for the selected ADC regular channel its corresponding rank in the sequencer and its sample time.

Configure for the selected ADC regular channel its corresponding rank in the sequencer and its sample time.

Definition at line 32 of file adc.c.

References Error\_Handler(), and hadc1.

Referenced by main().

#### 7.1.3.2 MX\_ADC2\_Init()

```
void MX_ADC2_Init (
    void )
```

Configure the global features of the ADC (Clock, Resolution, Data Alignment and number of conversion)

Configure for the selected ADC regular channel its corresponding rank in the sequencer and its sample time.

Definition at line 118 of file adc.c.

References Error\_Handler(), and hadc2.

Referenced by main().

### 7.1.4 Variable Documentation

#### 7.1.4.1 hadc1

ADC\_HandleTypeDef hadc1

Definition at line 27 of file adc.c.

Referenced by HAL\_ADC\_LevelOutOfWindowCallback(), and MX\_ADC1\_Init().

#### 7.1.4.2 hadc2

ADC\_HandleTypeDef hadc2

Definition at line 28 of file adc.c.

Referenced by HAL\_TIM\_PeriodElapsedCallback(), and MX\_ADC2\_Init().

## 7.2 Core/Inc/bms.h File Reference

```
#include "main.h"
#include "uvfr_utils.h"
```

### Data Structures

- struct [bms\\_settings\\_t](#)

### Macros

- #define [DEFAULT\\_BMS\\_CAN\\_TIMEOUT](#) (([uv\\_timespan\\_ms](#))200)

### Typedefs

- typedef struct [bms\\_settings\\_t](#) [bms\\_settings\\_t](#)

### Functions

- void [BMS\\_Init](#) (void \*args)

#### 7.2.1 Macro Definition Documentation

### 7.2.1.1 DEFAULT\_BMS\_CAN\_TIMEOUT

```
#define DEFAULT_BMS_CAN_TIMEOUT ((uv_timespan_ms)200)
```

Definition at line 11 of file bms.h.

## 7.2.2 Typedef Documentation

### 7.2.2.1 bms\_settings\_t

```
typedef struct bms_settings_t bms_settings_t
```

## 7.2.3 Function Documentation

### 7.2.3.1 BMS\_Init()

```
void BMS_Init (  
    void * args )
```

Definition at line 11 of file bms.c.

References BMS, uv\_init\_task\_args::init\_info\_queue, uv\_init\_task\_args::meta\_task\_handle, and UV\_OK.

Referenced by uvInit().

## 7.3 Core/Inc/can.h File Reference

This file contains all the function prototypes for the [can.c](#) file.

```
#include "main.h"  
#include "constants.h"  
#include "uvfr_utils.h"
```

## Macros

- #define [CAN\\_TX\\_DAEMON\\_NAME](#) "CanTxDaemon"
- #define [CAN\\_RX\\_DAEMON\\_NAME](#) "CanRxDaemon"

## Typedefs

- typedef struct [uv\\_CAN\\_msg](#) [uv\\_CAN\\_msg](#)
- typedef enum [uv\\_status\\_t](#) [uv\\_status](#)

## Functions

- void [MX\\_CAN2\\_Init](#) (void)
- void [HAL\\_CAN\\_RxFifo0MsgPendingCallback](#) (CAN\_HandleTypeDef \*[hcan2](#))
- void [HAL\\_CAN\\_RxFifo1MsgPendingCallback](#) (CAN\_HandleTypeDef \*[hcan2](#))
- [uv\\_status](#) [uvSendCanMSG](#) ([uv\\_CAN\\_msg](#) \*msg)

*Function to send CAN message.*

- void [CANbusTxSvcDaemon](#) (void \*args)  
*Background task that handles any CAN messages that are being sent.*
- void [CANbusRxSvcDaemon](#) (void \*args)  
*Background task that executes the CAN message callback functions.*
- void [insertCANMessageHandler](#) (uint32\_t id, void \*handlerfunc)  
*Function to insert an id and function into the lookup table of callback functions.*
- void [nuke\\_hash\\_table](#) ()

## Variables

- CAN\_HandleTypeDef [hcan2](#)

### 7.3.1 Detailed Description

This file contains all the function prototypes for the [can.c](#) file.

/** USER CODE END Header
```

### 7.3.2 Macro Definition Documentation

#### 7.3.2.1 CAN\_RX\_DAEMON\_NAME

```
#define CAN_RX_DAEMON_NAME "CanRxDaemon"
```

Definition at line 41 of file [can.h](#).

### 7.3.2.2 CAN\_TX\_DAEMON\_NAME

```
#define CAN_TX_DAEMON_NAME "CanTxDaemon"
```

Definition at line 40 of file can.h.

## 7.3.3 Typedef Documentation

### 7.3.3.1 uv\_CAN\_msg

```
typedef struct uv_CAN_msg uv_CAN_msg
```

Definition at line 43 of file can.h.

### 7.3.3.2 uv\_status

```
typedef enum uv_status_t uv_status
```

Definition at line 44 of file can.h.

## 7.3.4 Function Documentation

### 7.3.4.1 CANbusRxSvcDaemon()

```
void CANbusRxSvcDaemon (  
    void * args )
```

Background task that executes the CAN message callback functions.

Basically just snoops through the hash table

Definition at line 618 of file can.c.

References `callback_table_mutex`, `callFunctionFromCANid()`, `uv_task_info::cmd_data`, `killSelf()`, `Rx_msg_queue`, `suspendSelf()`, `uv_task_info::task_handle`, `UV_KILL_CMD`, `UV_OK`, and `UV_SUSPEND_CMD`.

Referenced by `uvSVCTaskManager()`.

#### 7.3.4.2 CANbusTxSvcDaemon()

```
void CANbusTxSvcDaemon (
    void * args )
```

Background task that handles any CAN messages that are being sent.

This task sits idle, until the time is right (it receives a notification from the `uvSendCanMSG` function) Once this condition has been met, it will actually call the `HAL_CAN_AddTxMessage` function. This is a very high priority task, meaning that it will pause whatever other code is going in order to run

Definition at line 551 of file `can.c`.

References `uv_task_info::cmd_data`, `uv_CAN_msg::data`, `uv_CAN_msg::dlc`, `uv_CAN_msg::flags`, `hcan2`, `killSelf()`, `uv_CAN_msg::msg_id`, `suspendSelf()`, `Tx_msg_queue`, `TxHeader`, `TxMailbox`, `UV_CAN_EXTENDED_ID`, `UV_KILL_CMD`, and `UV_SUSPEND_CMD`.

Referenced by `uvSVCTaskManager()`.

#### 7.3.4.3 HAL\_CAN\_RxFifo0MsgPendingCallback()

```
void HAL_CAN_RxFifo0MsgPendingCallback (
    CAN_HandleTypeDef * hcan2 )
```

Definition at line 298 of file `can.c`.

References `uv_CAN_msg::data`, `uv_CAN_msg::dlc`, `Error_Handler()`, `hcan2`, `uv_CAN_msg::msg_id`, `Rx_msg_queue`, and `RxHeader`.

#### 7.3.4.4 HAL\_CAN\_RxFifo1MsgPendingCallback()

```
void HAL_CAN_RxFifo1MsgPendingCallback (
    CAN_HandleTypeDef * hcan2 )
```

Definition at line 338 of file `can.c`.

#### 7.3.4.5 MX\_CAN2\_Init()

```
void MX_CAN2_Init (
    void )
```

Definition at line 150 of file `can.c`.

References `Error_Handler()`, `hcan2`, and `TxHeader`.

Referenced by `main()`.

### 7.3.4.6 nuke\_hash\_table()

```
void nuke_hash_table ( )
```

Function to free all malloced memory Index through the hash table and free all the malloced memory at each index

Definition at line 453 of file can.c.

References `CAN_callback_table`, `CAN_Callback::next`, and `table_size`.

## 7.3.5 Variable Documentation

### 7.3.5.1 hcan2

```
CAN_HandleTypeDef hcan2
```

Definition at line 147 of file can.c.

## 7.5.4 Function Documentation

### 7.5.4.1 daqMasterTask()

```
void daqMasterTask (
    void * args )
```

These here lines set the delay. This task executes exactly at the period specified, regardless of how long the task execution actually takes

```
*/
TickType_t tick_period = pdMS_TO_TICKS(params->task_period); //Convert ms of period to the RTOS ticks
//TickType_t last_time = xTaskGetTickCount();                /**
```

Definition at line 62 of file daq.c.

References `changeVehicleState()`, `uv_task_info::cmd_data`, `killSelf()`, `suspendSelf()`, `uv_task_info::task_period`, `UV_DRIVING`, `UV_ERROR_STATE`, `UV_KILL_CMD`, `UV_READY`, `UV_SUSPEND_CMD`, and `vehicle_state`.

Referenced by `initDaqTask()`.

### 7.5.4.2 initDaqTask()

```
enum uv_status_t initDaqTask (
    void * args )
```

initializes the master DAQ task, all that fun stuff. This task probably manages a while plethora of smaller tasks

This is a fairly standard function

Definition at line 30 of file daq.c.

References `_UV_DEFAULT_TASK_STACK_SIZE`, `uv_task_info::active_states`, `daqMasterTask()`, `uv_task_info::deletion_states`, `PROGRAMMING`, `uv_task_info::stack_size`, `uv_task_info::suspension_states`, `uv_task_info::task_args`, `uv_task_info::task_function`, `uv_task_info::task_name`, `uv_task_info::task_period`, `uv_task_info::task_priority`, `UV_DRIVING`, `UV_ERROR`, `UV_ERROR_STATE`, `UV_LAUNCH_CONTROL`, `UV_OK`, `UV_READY`, and `uvCreateTask()`.

## Enumerations

- enum `map_mode` {  
    `linear_speed_map`, `s_curve_speed_map`, `exp_speed_map`, `linear_torque_map`,  
    `s_curve_torque_map`, `exp_torque_map` }  
    *DL\_PERIOD is meant to represent how often the driving loop executes, in ms.*
- enum `DL_internal_state` { `Plausible` = 0x01, `Implausible` = 0x02, `Erroneous` = 0x04 }

## Functions

- enum `uv_status_t` `initDrivingLoop` (void \*argument)
- void `StartDrivingLoop` (void \*argument)  
    *Function implementing the ledTask thread.*

### 7.8.1 Typedef Documentation

#### 7.8.1.1 driving\_loop\_args

```
typedef struct driving_loop_args driving_loop_args
```

#### 7.8.1.2 drivingMode

```
typedef struct drivingMode drivingMode
```

This is where the driving mode and the `drivingModeParams` are at.

#### 7.8.1.3 drivingModeParams

```
typedef union drivingModeParams drivingModeParams
```

this struct is designed to hold information about each drivingmode's map params

#### 7.8.1.4 exp\_torque\_map\_args

```
typedef struct exp_torque_map_args exp_torque_map_args
```

struct to hold parameters used in an exponential torque map

#### 7.8.1.5 linear\_torque\_map\_args

```
typedef struct linear_torque_map_args linear_torque_map_args
```

#### 7.8.1.6 MC\_POWER

```
typedef uint16_t MC_POWER
```

Definition at line 16 of file driving\_loop.h.

#### 7.8.1.7 MC\_RPM

```
typedef uint16_t MC_RPM
```

Definition at line 15 of file driving\_loop.h.

#### 7.8.1.8 MC\_Torque

```
typedef uint16_t MC_Torque
```

Definition at line 14 of file driving\_loop.h.

#### 7.8.1.9 s\_curve\_torque\_map\_args

```
typedef struct s_curve_torque_map_args s_curve_torque_map_args
```

struct for s-curve parameters for torque

### 7.8.2 Enumeration Type Documentation

#### 7.8.2.1 DL\_internal\_state

```
enum DL_internal_state
```

Enumerator

Plausible	
Implausible	
Erroneous	

Definition at line 42 of file driving\_loop.h.

### 7.8.2.2 map\_mode

enum `map_mode`

DL\_PERIOD is meant to represent how often the driving loop executes, in ms.

This is a define since I would eventually like this to be configurable via a global variable, or possible be dynamic in the future.

Just replace the number with the name of the variable, and you're all set.

enum meant to represent the different types of pedal map

This enum is meant to represent different functions that map the torque to speed.

Enumerator

linear_speed_map	
s_curve_speed_map	
exp_speed_map	
linear_torque_map	
s_curve_torque_map	
exp_torque_map	

Definition at line 33 of file driving\_loop.h.

## 7.8.3 Function Documentation

### 7.8.3.1 initDrivingLoop()

```
enum uv_status_t initDrivingLoop (  
    void * argument )
```

Definition at line 25 of file driving\_loop.c.

References `uv_task_info::active_states`, `uv_task_info::deletion_states`, `PROGRAMMING`, `uv_task_info::stack_size`, `StartDrivingLoop()`, `uv_task_info::suspension_states`, `uv_task_info::task_args`, `uv_task_info::task_function`, `uv_task_info::task_name`, `uv_task_info::task_period`, `uv_task_info::task_priority`, `UV_DRIVING`, `UV_ERROR`, `UV_ERROR_STATE`, `UV_INIT`, `UV_LAUNCH_CONTROL`, `UV_OK`, `UV_READY`, `UV_SUSPENDED`, and `uvCreateTask()`.

Referenced by `uvInitStateEngine()`.

### 7.8.3.2 StartDrivingLoop()

```
void StartDrivingLoop (
    void * argument )
```

Function implementing the `ledTask` thread.

Parameters

<i>argument</i>	Not used for now. Will have configuration settings later.
-----------------	---

Return values

<i>None</i>	This function is made to be the meat and potatoes of the entire vehicle.
-------------	--

The first thing we do here is create some local variables here, to cache whatever variables need cached. We will be caching variables that are used very frequently in every single loop iteration, and are not

This line extracts the specific driving loop parameters as specified in the vehicle settings

```
*/
driving_loop_args* dl_params = (driving_loop_args*) params->task_args;
/**
```

These here lines set the delay. This task executes exactly at the period specified, regardless of how long the task execution actually takes

```
*/
TickType_t tick_period = pdMS_TO_TICKS(params->task_period); //Convert ms of period to the RTOS ticks
TickType_t last_time = xTaskGetTickCount();
/**
```

#### Brake Plausibility Check

The way that this works is that if the brake pressure is greater than some threshold, and the accelerator pedal position is also greater than some threshold, the thing will register that a brake implausibility has occurred. This is not very cash money.

If this happens, we want to set the torque/speed output to zero. This will only reset itself once the brakes are set to less than a certain threshold. Honestly evil.

Definition at line 68 of file `driving_loop.c`.

References `adc1_APPS1`, `adc1_APPS2`, `adc1_BPS1`, `adc1_BPS2`, `driving_loop_args::apps_plausibility_check_threshold`, `driving_loop_args::bps_plausibility_check_threshold`, `uv_task_info::cmd_data`, `Implausible`, `killSelf()`, `driving_loop_args::max_apps_offset`, `driving_loop_args::max_apps_value`, `driving_loop_args::max_BPS_value`, `Plausible`, `suspendSelf()`, `uv_task_info::task_args`, `uv_task_info::task_period`, `UV_KILL_CMD`, and `UV_SUSPEND_CMD`.

Referenced by `initDrivingLoop()`.

### 7.12.1 Enumeration Type Documentation

#### 7.12.1.1 imd\_error\_flags

```
enum imd_error_flags
```

Enumerator

Err_temp	
Err_clock	
Err_Watchdog	
Err_Vpwr	
Err_Vexi	
Err_VxR	
Err_CH	
Err_Vx1	
Err_Vx2	

Definition at line 68 of file imd.h.

### 7.12.1.2 imd\_high\_resolution\_measurements

```
enum imd_high_resolution_measurements
```

Enumerator

Vn_hi_res	
Vp_hi_res	
Vexc_hi_res	
Vb_hi_res	
Vpwr_hi_res	

Definition at line 98 of file imd.h.

### 7.12.1.3 imd\_manufacturer\_requests

```
enum imd_manufacturer_requests
```

Enumerator

Part_name_0	
Part_name_1	
Part_name_2	
Part_name_3	
Version_0	
Version_1	
Version_2	
Serial_number↵ _0	
Serial_number↵ _1	

Enumerator

Serial_number↔ _2	
Serial_number↔ _3	
Uptime_counter	

Definition at line 82 of file imd.h.

#### 7.12.1.4 imd\_status\_bits

```
enum imd_status_bits
```

Enumerator

Isolation_status_bit0	
Isolation_status_bit1	
Low_Battery_Voltage	
High_Battery_Voltage	
Exc_off	
High_Uncertainty	
Touch_energy_fault	
Hardware_Error	

Definition at line 16 of file imd.h.

#### 7.12.1.5 imd\_status\_requests

```
enum imd_status_requests
```

Enumerator

isolation_state	
isolation_resistances	
isolation_capacitances	
voltages_Vp_and_Vn	
battery_voltage	
Error_flags	
safety_touch_energy	
safety_touch_current	
Max_battery_working_voltage	
Temperature	

Definition at line 32 of file imd.h.

## 7.12.2 Function Documentation

### 7.12.2.1 IMD\_Check\_Battery\_Voltage()

```
void IMD_Check_Battery_Voltage (
    uint8_t Data[] )
```

Definition at line 351 of file imd.c.

Referenced by IMD\_Parse\_Message().

### 7.12.2.2 IMD\_Check\_Error\_Flags()

```
void IMD_Check_Error_Flags (
    uint8_t Data[] )
```

Definition at line 257 of file imd.c.

References Err\_CH, Err\_clock, Err\_temp, Err\_Vexi, Err\_Vpwr, Err\_Vx1, Err\_Vx2, Err\_VxR, and Err\_Watchdog.

Referenced by IMD\_Parse\_Message().

### 7.12.2.3 IMD\_Check\_Isolation\_Capacitances()

```
void IMD_Check_Isolation_Capacitances (
    uint8_t Data[] )
```

Definition at line 337 of file imd.c.

Referenced by IMD\_Parse\_Message().

### 7.12.2.4 IMD\_Check\_Isolation\_Resistances()

```
void IMD_Check_Isolation_Resistances (
    uint8_t Data[] )
```

Definition at line 312 of file imd.c.

References IMD\_High\_Uncertainty.

Referenced by IMD\_Parse\_Message().

#### 7.12.2.5 IMD\_Check\_Isolation\_State()

```
void IMD_Check_Isolation_State (
    uint8_t Data[] )
```

Definition at line 296 of file imd.c.

References IMD\_High\_Uncertainty.

Referenced by IMD\_Parse\_Message().

#### 7.12.2.6 IMD\_Check\_Max\_Battery\_Working\_Voltage()

```
void IMD_Check_Max_Battery_Working_Voltage (
    uint8_t Data[] )
```

Definition at line 388 of file imd.c.

Referenced by IMD\_Parse\_Message().

#### 7.12.2.7 IMD\_Check\_Part\_Name()

```
void IMD_Check_Part_Name (
    uint8_t Data[] )
```

Definition at line 401 of file imd.c.

References IMD\_Expected\_Part\_Name, IMD\_Part\_Name\_0\_Set, IMD\_Part\_Name\_1\_Set, IMD\_Part\_Name\_2\_Set, IMD\_Part\_Name\_3\_Set, IMD\_Part\_Name\_Set, IMD\_Read\_Part\_Name, Part\_name\_0, Part\_name\_1, Part\_name\_2, and Part\_name\_3.

Referenced by IMD\_Parse\_Message().

#### 7.12.2.8 IMD\_Check\_Safety\_Touch\_Current()

```
void IMD_Check_Safety_Touch_Current (
    uint8_t Data[] )
```

Definition at line 376 of file imd.c.

Referenced by IMD\_Parse\_Message().

### 7.12.2.9 IMD\_Check\_Safety\_Touch\_Energy()

```
void IMD_Check_Safety_Touch_Energy (
    uint8_t Data[] )
```

Definition at line 369 of file imd.c.

Referenced by IMD\_Parse\_Message().

### 7.12.2.10 IMD\_Check\_Serial\_Number()

```
void IMD_Check_Serial_Number (
    uint8_t Data[] )
```

Definition at line 483 of file imd.c.

References IMD\_Expected\_Serial\_Number, IMD\_Read\_Serial\_Number, IMD\_Serial\_Number\_0\_Set, IMD\_Serial\_Number\_1\_Set, IMD\_Serial\_Number\_2\_Set, IMD\_Serial\_Number\_3\_Set, IMD\_Serial\_Number\_Set, Serial\_number\_0, Serial\_number\_1, Serial\_number\_2, and Serial\_number\_3.

Referenced by IMD\_Parse\_Message().

### 7.12.2.11 IMD\_Check\_Status\_Bits()

```
void IMD_Check_Status_Bits (
    uint8_t Data )
```

Definition at line 213 of file imd.c.

References Error\_flags, Hardware\_Error, High\_Battery\_Voltage, High\_Uncertainty, IMD\_error\_flags\_requested, IMD\_High\_Uncertainty, IMD\_Request\_Status(), Isolation\_status\_bit0, Isolation\_status\_bit1, and Low\_Battery\_Voltage.

Referenced by IMD\_Parse\_Message().

### 7.12.2.12 IMD\_Check\_Temperature()

```
void IMD_Check_Temperature (
    uint8_t Data[] )
```

Definition at line 358 of file imd.c.

References IMD\_Temperature.

Referenced by IMD\_Parse\_Message().

**7.12.2.13 IMD\_Check\_Uptime()**

```
void IMD_Check_Uptime (
    uint8_t Data[] )
```

Definition at line 524 of file imd.c.

**7.12.2.14 IMD\_Check\_Version()**

```
void IMD_Check_Version (
    uint8_t Data[] )
```

Definition at line 443 of file imd.c.

References `IMD_Expected_Version`, `IMD_Read_Version`, `IMD_Version_0_Set`, `IMD_Version_1_Set`, `IMD_Version_2_Set`, `IMD_Version_Set`, `Version_0`, `Version_1`, and `Version_2`.

Referenced by `IMD_Parse_Message()`.

**7.12.2.15 IMD\_Check\_Voltages\_Vp\_and\_Vn()**

```
void IMD_Check_Voltages_Vp_and_Vn (
    uint8_t Data[] )
```

Definition at line 344 of file imd.c.

Referenced by `IMD_Parse_Message()`.

**7.12.2.16 IMD\_Parse\_Message()**

```
void IMD_Parse_Message (
    int DLC,
    uint8_t Data[] )
```

Definition at line 68 of file imd.c.

References `battery_voltage`, `Error_flags`, `Error_Handler()`, `IMD_Check_Battery_Voltage()`, `IMD_Check_Error_Flags()`, `IMD_Check_Isolation_Capacitances()`, `IMD_Check_Isolation_Resistances()`, `IMD_Check_Isolation_State()`, `IMD_Check_Max_Battery_Working_Voltage()`, `IMD_Check_Part_Name()`, `IMD_Check_Safety_Touch_Current()`, `IMD_Check_Safety_Touch_Energy()`, `IMD_Check_Serial_Number()`, `IMD_Check_Status_Bits()`, `IMD_Check_Temperature()`, `IMD_Check_Version()`, `IMD_Check_Voltages_Vp_and_Vn()`, `isolation_capacitances`, `isolation_resistances`, `isolation_state`, `Max_battery_working_voltage`, `Part_name_0`, `Part_name_1`, `Part_name_2`, `Part_name_3`, `safety_touch_current`, `safety_touch_energy`, `Serial_number_0`, `Serial_number_1`, `Serial_number_2`, `Serial_number_3`, `Temperature`, `Uptime_counter`, `Vb_hi_res`, `Version_0`, `Version_1`, `Version_2`, `Vexc_hi_res`, `Vn_hi_res`, `voltages_Vp_and_Vn`, `Vp_hi_res`, and `Vpwr_hi_res`.

#### 7.12.2.17 IMD\_Request\_Status()

```
void IMD_Request_Status (
    uint8_t Status )
```

Definition at line 180 of file imd.c.

References `Error_Handler()`, `hcan2`, `IMD_CAN_ID_Tx`, `TxData`, `TxHeader`, and `TxMailbox`.

Referenced by `IMD_Check_Status_Bits()`, and `IMD_Startup()`.

#### 7.12.2.18 IMD\_Startup()

```
void IMD_Startup ( )
```

Definition at line 528 of file imd.c.

References `IMD_Request_Status()`, `isolation_state`, `Max_battery_working_voltage`, `Part_name_0`, `Part_name_1`, `Part_name_2`, `Part_name_3`, `Serial_number_0`, `Serial_number_1`, `Serial_number_2`, `Serial_number_3`, `Version_0`, `Version_1`, and `Version_2`.

#### 7.12.2.19 initIMD()

```
void initIMD (
    void * args )
```

Definition at line 554 of file imd.c.

References `IMD`, `uv_init_task_args::init_info_queue`, `uv_init_task_args::meta_task_handle`, and `UV_OK`.

Referenced by `uvInit()`.

## 7.13 Core/Inc/main.h File Reference

: Header for [main.c](#) file. This file contains the common defines of the application.

```
#include "stm32f4xx_hal.h"
#include <stdarg.h>
#include "uvfr_utils.h"
```

## Macros

- `#define Start_Button_Input_Pin GPIO_PIN_0`

## 7.14.1 Macro Definition Documentation

### 7.14.1.1 DEFAULT\_MOTOR\_CONTROLLER\_CAN\_TIMEOUT

```
#define DEFAULT_MOTOR_CONTROLLER_CAN_TIMEOUT ((uv_timespan_ms)200)
```

Definition at line 15 of file motor\_controller.h.

### 7.14.1.2 FIRMWARE\_VERSION\_REGISTER

```
#define FIRMWARE_VERSION_REGISTER 0x1B
```

Definition at line 20 of file motor\_controller.h.

### 7.14.1.3 SERIAL\_NUMBER\_REGISTER

```
#define SERIAL_NUMBER_REGISTER 0x1A
```

Definition at line 19 of file motor\_controller.h.

## 7.14.2 Typedef Documentation

### 7.14.2.1 motor\_controller\_settings

```
typedef struct motor_controller_settings motor_controller_settings
```

## 7.14.3 Enumeration Type Documentation

### 7.14.3.1 motor\_controller\_current\_parameters

```
enum motor_controller_current_parameters
```

Enumerator

todo1	
-------	--

Definition at line 30 of file motor\_controller.h.

### 7.14.3.2 motor\_controller\_io

```
enum motor_controller_io
```

Enumerator

todo6969	
----------	--

Definition at line 113 of file motor\_controller.h.

### 7.14.3.3 motor\_controller\_limp\_mode

```
enum motor_controller_limp_mode
```

Enumerator

N_lim	
N_lim_plus	
N_lim_minus	

Definition at line 138 of file motor\_controller.h.

### 7.14.3.4 motor\_controller\_measurements

```
enum motor_controller_measurements
```

Enumerator

DC_bus_voltage	
----------------	--

Definition at line 68 of file motor\_controller.h.

### 7.14.3.5 motor\_controller\_motor\_constants

enum `motor_controller_motor_constants`

Enumerator

nominal_motor_frequency	
nominal_motor_voltage	
power_factor	
motor_max_current	
motor_continuous_current	
motor_pole_number	
motor_kt_constant	
motor_ke_constant	
rated_motor_speed	
motor_temperature_switch_off_point	
stator_leakage_inductance	
nominal_magnetizing_current	
motor_magnetising_inductance	
rotor_resistance	
minimum_magnetising_current	
time_constant_rotor	
leakage_inductance_ph_ph	
stator_resistance_ph_ph	
time_constant_stator	

Definition at line 34 of file `motor_controller.h`.

### 7.14.3.6 motor\_controller\_PI\_values

enum `motor_controller_PI_values`

Enumerator

accelerate_ramp	
dismantling_ramp	
recuperation_ramp	
proportional_gain	
integral_time_constant	
integral_memory_max	
proportional_gain_2	
current_feed_forward	
ramp_set_current	

Definition at line 117 of file `motor_controller.h`.

### 7.14.3.7 motor\_controller\_repeating\_time

enum `motor_controller_repeating_time`

Enumerator

<code>none</code>	
<code>one_hundred_ms</code>	

Definition at line 133 of file `motor_controller.h`.

### 7.14.3.8 motor\_controller\_speed\_parameters

enum `motor_controller_speed_parameters`

Enumerator

<code>N_actual</code>	
<code>N_set</code>	
<code>N_cmd</code>	
<code>N_error</code>	

Definition at line 23 of file `motor_controller.h`.

### 7.14.3.9 motor\_controller\_startup

enum `motor_controller_startup`

Enumerator

<code>clear_errors</code>	
<code>firmware_version</code>	

Definition at line 144 of file `motor_controller.h`.

### 7.14.3.10 motor\_controller\_status\_information\_errors\_warnings

enum `motor_controller_status_information_errors_warnings`

Enumerator

<code>motor_controller_errors_warnings</code>	
---	--

## Enumerator

eprom_read_error	
hardware_fault	
rotate_field_enable_not_present_run	
CAN_timeout_error	
face_away_detected	

Enumerator

temp_sensor_pt1	
temp_sensor_pt2	
temp_sensor_pt3	
temp_sensor_pt4	

Definition at line 57 of file motor\_controller.h.

## 7.14.4 Function Documentation

### 7.14.4.1 MC\_Startup()

```
void MC_Startup (
    void * args )
```

Initializes the motor controller by performing the following steps:

1. Verifies the serial number from the motor controller.
2. Checks the firmware version to ensure compatibility.
3. Executes a motor spin test at low RPM to validate functionality.
4. Checks for errors and warnings from the motor controller.
5. Logs successful initialization if all checks pass.

Definition at line 739 of file motor\_controller.c.

References `firmware_version`, `FIRMWARE_VERSION_REGISTER`, `uv_init_task_args::init_info_queue`, `MC_Expected_FW_Version`, `MC_Expected_Serial_Number`, `MC_Request_Data()`, `uv_init_task_args::meta_task_handle`, `MOTOR_CONTROLLER`, `motor_controller_errors_warnings`, `MotorControllerErrorHandler()`, `MotorControllerSpinTest()`, `Parse_Bamocar_Response()`, `RxData`, `SERIAL_NUMBER_REGISTER`, `uv_init_task_args::specific_args`, `UV_OK`, and `WaitFor_CAN_Response()`.

Referenced by `uvInit()`.

## 7.15 Core/Inc/odometer.h File Reference

### Functions

- [uv\\_status initOdometer](#) (void \*args)
- void [odometerTask](#) (void \*args)  
*, gotta know what the distance travelled is fam*

## 7.15.1 Function Documentation

### 7.15.1.1 initOdometer()

```
uv_status initOdometer (
    void * args )
```

Definition at line 11 of file odometer.c.

References `_UV_DEFAULT_TASK_STACK_SIZE`, `uv_task_info::active_states`, `uv_task_info::deletion_states`, `odometerTask()`, `PROGRAMMING`, `uv_task_info::stack_size`, `uv_task_info::suspension_states`, `uv_task_info::task_args`, `uv_task_info::task_function`, `uv_task_info::task_name`, `uv_task_info::task_period`, `uv_task_info::task_priority`, `UV_DRIVING`, `UV_ERROR`, `UV_ERROR_STATE`, `UV_LAUNCH_CONTROL`, `UV_OK`, `UV_READY`, and `uvCreateTask()`.

Referenced by `uvInitStateEngine()`.

### 7.15.1.2 odometerTask()

```
void odometerTask (
    void * args )
```

, gotta know what the distance travelled is fam

These here lines set the delay. This task executes exactly at the period specified, regardless of how long the task execution actually takes

```
*/
TickType_t tick_period = pdMS_TO_TICKS(params->task_period); //Convert ms of period to the RTOS ticks
TickType_t last_time = xTaskGetTickCount();
/**
```

Definition at line 46 of file odometer.c.

References `uv_task_info::cmd_data`, `killSelf()`, `suspendSelf()`, `uv_task_info::task_period`, `UV_KILL_CMD`, and `UV_SUSPEND_CMD`.

Referenced by `initOdometer()`.

## 7.16 Core/Inc/oled.h File Reference

```
#include "uvfr_utils.h"
```

## Functions

- void [wait](#) (uint32\_t t)

## 7.17.2 Function Documentation

### 7.17.2.1 initPDU()

```
void initPDU (  
    void * args )
```

Definition at line 183 of file pdu.c.

References `uv_init_task_args::init_info_queue`, `uv_init_task_args::meta_task_handle`, `PDU`, and `UV_OK`.

Referenced by `uvInit()`.

### 7.17.2.2 PDU\_disable\_brake\_light()

```
void PDU_disable_brake_light ( )
```

Definition at line 48 of file pdu.c.

References `disable_brake_light_msg`, `Error_Handler()`, `hcan2`, `PDU_CAN_ID_Tx`, `TxData`, `TxHeader`, and `TxMailbox`.

### 7.17.2.3 PDU\_disable\_coolant\_pump()

```
void PDU_disable_coolant_pump ( )
```

Definition at line 170 of file pdu.c.

References `disable_coolant_pump_msg`, `Error_Handler()`, `hcan2`, `PDU_CAN_ID_Tx`, `TxData`, `TxHeader`, and `TxMailbox`.

### 7.17.2.4 PDU\_disable\_cooling\_fans()

```
void PDU_disable_cooling_fans ( )
```

Definition at line 136 of file pdu.c.

References `disable_left_cooling_fan_msg`, `disable_right_cooling_fan_msg`, `Error_Handler()`, `hcan2`, `PDU_CAN_ID_Tx`, `TxData`, `TxHeader`, and `TxMailbox`.

### 7.17.2.5 PDU\_disable\_motor\_controller()

```
void PDU_disable_motor_controller ( )
```

Definition at line 74 of file pdu.c.

References `disable_motor_controller_msg`, `Error_Handler()`, `hcan2`, `PDU_CAN_ID_Tx`, `TxData`, `TxHeader`, and `TxMailbox`.

### 7.17.2.6 PDU\_disable\_shutdown\_circuit()

```
void PDU_disable_shutdown_circuit ( )
```

Definition at line 100 of file pdu.c.

References `disable_shutdown_circuit_msg`, `Error_Handler()`, `hcan2`, `PDU_CAN_ID_Tx`, `TxData`, `TxHeader`, and `TxMailbox`.

### 7.17.2.7 PDU\_enable\_brake\_light()

```
void PDU_enable_brake_light ( )
```

Definition at line 34 of file pdu.c.

References enable\_brake\_light\_msg, Error\_Handler(), hcan2, PDU\_CAN\_ID\_Tx, TxData, TxHeader, and TxMailbox.

### 7.17.2.8 PDU\_enable\_coolant\_pump()

```
void PDU_enable_coolant_pump ( )
```

Definition at line 158 of file pdu.c.

References enable\_coolant\_pump\_msg, Error\_Handler(), hcan2, PDU\_CAN\_ID\_Tx, TxData, TxHeader, and TxMailbox.

### 7.17.2.9 PDU\_enable\_cooling\_fans()

```
void PDU_enable_cooling_fans ( )
```

Definition at line 115 of file pdu.c.

References enable\_left\_cooling\_fan\_msg, enable\_right\_cooling\_fan\_msg, Error\_Handler(), hcan2, PDU\_CAN\_ID\_Tx, TxData, TxHeader, and TxMailbox.

### 7.17.2.10 PDU\_enable\_motor\_controller()

```
void PDU_enable_motor_controller ( )
```

Definition at line 62 of file pdu.c.

References enable\_motor\_controller\_msg, Error\_Handler(), hcan2, PDU\_CAN\_ID\_Tx, TxData, TxHeader, and TxMailbox.

### 7.17.2.11 PDU\_enable\_shutdown\_circuit()

```
void PDU_enable_shutdown_circuit ( )
```

Definition at line 87 of file pdu.c.

References enable\_shutdown\_circuit\_msg, Error\_Handler(), hcan2, PDU\_CAN\_ID\_Tx, TxData, TxHeader, and TxMailbox.

### 7.17.2.12 PDU\_speaker\_chirp()

```
void PDU_speaker_chirp ( )
```

Definition at line 11 of file pdu.c.

References `disable_speaker_msg`, `enable_speaker_msg`, `Error_Handler()`, `hcan2`, `PDU_CAN_ID_Tx`, `TxData`, `TxHeader`, and `TxMailbox`.

## 7.18.4 Function Documentation

### 7.18.4.1 rbApplyNode()

```
int rbApplyNode (
    rbtree * rbt,
    rbnode * node,
    int(*) (void *, void *) func,
    void * cookie,
    enum rbtraversal order )
```

#### 7.18.4.2 rbCheckBlackHeight()

```
int rbCheckBlackHeight (
    rbtree * rbt )
```

Definition at line 551 of file rb\_tree.c.

References `checkBlackHeight()`, `RB_FIRST`, `RB_NIL`, `RB_ROOT`, and `RED`.

Referenced by `rbPrint()`.

#### 7.18.4.3 rbCheckOrder()

```
int rbCheckOrder (
    rbtree * rbt,
    void * min,
    void * max )
```

Definition at line 525 of file rb\_tree.c.

References `checkOrder()`, and `RB_FIRST`.

#### 7.18.4.4 rbCreate()

```
rbtree* rbCreate (
    int(*) (const void *, const void *) compare_func,
    void(*) (void *) destroy_func )
```

Create and initialize a binary search tree.

Definition at line 26 of file rb\_tree.c.

References `BLACK`, `rbnode::color`, `rbtree::compare`, `rbtree::count`, `rbnode::data`, `rbtree::destroy`, `rbnode::left`, `rbtree::min`, `rbtree::nil`, `rbnode::parent`, `RB_NIL`, `rbnode::right`, and `rbtree::root`.

#### 7.18.4.5 rbDelete()

```
void* rbDelete (
    rbtree * rbt,
    rbnode * node,
    int keep )
```

Definition at line 344 of file rb\_tree.c.

References `BLACK`, `rbnode::color`, `rbtree::count`, `rbnode::data`, `deleteRepair()`, `rbtree::destroy`, `rbnode::left`, `rbtree::min`, `rbnode::parent`, `RB_FIRST`, `RB_NIL`, `rbSuccessor()`, `RED`, and `rbnode::right`.

#### 7.18.4.6 rbDestroy()

```
void rbDestroy (
    rbtree * rbt )
```

Destroy the tree, and de-allocate it's elements.

Definition at line 59 of file rb\_tree.c.

References `destroyAllNodes()`, and `RB_FIRST`.

#### 7.18.4.7 rbFind()

```
rbnode* rbFind (
    rbtree * rbt,
    void * data )
```

Find a node of the tree based off the data you provide the tree.

Definition at line 69 of file rb\_tree.c.

References `rbtree::compare`, `rbnode::data`, `rbnode::left`, `RB_FIRST`, `RB_NIL`, and `rbnode::right`.

#### 7.18.4.8 rbInsert()

```
rbnode* rbInsert (
    rbtree * rbt,
    void * data )
```

Definition at line 191 of file rb\_tree.c.

References `BLACK`, `rbnode::color`, `rbtree::compare`, `rbtree::count`, `rbnode::data`, `rbtree::destroy`, `insertRepair()`, `rbnode::left`, `rbtree::min`, `rbnode::parent`, `RB_FIRST`, `RB_MIN`, `RB_NIL`, `RB_ROOT`, `RED`, and `rbnode::right`.

#### 7.18.4.9 rbPrint()

```
void rbPrint (
    rbtree * rbt,
    void(*) (void *) print_func )
```

Definition at line 587 of file rb\_tree.c.

References `print()`, `RB_FIRST`, and `rbCheckBlackHeight()`.

#### 7.18.4.10 rbSuccessor()

```
rbnode* rbSuccessor (
    rbtree * rbt,
    rbnode * node )
```

Definition at line 90 of file rb\_tree.c.

References `rbnode::left`, `rbnode::parent`, `RB_NIL`, `RB_ROOT`, and `rbnode::right`.

Referenced by `rbDelete()`.

## 7.19 Core/Inc/spi.h File Reference

This file contains all the function prototypes for the `spi.c` file.

```
#include "main.h"
```

### Functions

- void `MX_SPI1_Init` (void)

### Variables

- `SPI_HandleTypeDef` `hspl1`

#### 7.19.1 Detailed Description

This file contains all the function prototypes for the `spi.c` file.

Attention

Copyright (c) 2024 STMicroelectronics. All rights reserved.

This software is licensed under terms that can be found in the LICENSE file in the root directory of this software component. If no LICENSE file comes with this software, it is provided AS-IS.

#### 7.19.2 Function Documentation

### 7.19.2.1 MX\_SPI1\_Init()

```
void MX_SPI1_Init (
    void )
```

Definition at line 30 of file spi.c.

References `Error_Handler()`, and `hspi1`.

Referenced by `main()`.

## 7.19.3 Variable Documentation

### 7.19.3.1 hspi1

```
SPI_HandleTypeDef hspi1
```

Definition at line 27 of file spi.c.

Referenced by `MX_SPI1_Init()`.

## 7.20 Core/Inc/stm32f4xx\_hal\_conf.h File Reference

HAL configuration template file. This file should be copied to the application folder and renamed to [stm32f4xx\\_hal\\_conf.h](#).

```
#include "stm32f4xx_hal_rcc.h"
#include "stm32f4xx_hal_gpio.h"
#include "stm32f4xx_hal_exti.h"
#include "stm32f4xx_hal_dma.h"
#include "stm32f4xx_hal_cortex.h"
#include "stm32f4xx_hal_adc.h"
#include "stm32f4xx_hal_can.h"
#include "stm32f4xx_hal_flash.h"
#include "stm32f4xx_hal_pwr.h"
#include "stm32f4xx_hal_spi.h"
#include "stm32f4xx_hal_tim.h"
```

### 7.20.2 Macro Definition Documentation

#### 7.20.2.1 `assert_param`

```
#define assert_param(  
    expr ) ((void)0U)
```

Include module's header file.

Definition at line 488 of file `stm32f4xx_hal_conf.h`.

#### 7.20.2.2 `DATA_CACHE_ENABLE`

```
#define DATA_CACHE_ENABLE 1U
```

Definition at line 155 of file `stm32f4xx_hal_conf.h`.

### 7.20.2.3 DP83848\_PHY\_ADDRESS

```
#define DP83848_PHY_ADDRESS
```

Definition at line 225 of file stm32f4xx\_hal\_conf.h.

### 7.20.2.4 ETH\_RX\_BUF\_SIZE

```
#define ETH_RX_BUF_SIZE ETH_MAX_PACKET_SIZE /* buffer size for receive */
```

Definition at line 217 of file stm32f4xx\_hal\_conf.h.

### 7.20.2.5 ETH\_RXBUFNB

```
#define ETH_RXBUFNB 4U /* 4 Rx buffers of size ETH_RX_BUF_SIZE */
```

Definition at line 219 of file stm32f4xx\_hal\_conf.h.

### 7.20.2.6 ETH\_TX\_BUF\_SIZE

```
#define ETH_TX_BUF_SIZE ETH_MAX_PACKET_SIZE /* buffer size for transmit */
```

Definition at line 218 of file stm32f4xx\_hal\_conf.h.

### 7.20.2.7 ETH\_TXBUFNB

```
#define ETH_TXBUFNB 4U /* 4 Tx buffers of size ETH_TX_BUF_SIZE */
```

Definition at line 220 of file stm32f4xx\_hal\_conf.h.

### 7.20.2.8 EXTERNAL\_CLOCK\_VALUE

```
#define EXTERNAL_CLOCK_VALUE 12288000U
```

External clock source for I2S peripheral This value is used by the I2S HAL module to compute the I2S clock source frequency, this source is inserted directly through I2S\_CKIN pad.

Value of the External audio frequency in Hz

Definition at line 140 of file stm32f4xx\_hal\_conf.h.

#### 7.20.2.9 HAL\_ADC\_MODULE\_ENABLED

```
#define HAL_ADC_MODULE_ENABLED
```

Definition at line 41 of file stm32f4xx\_hal\_conf.h.

#### 7.20.2.10 HAL\_CAN\_MODULE\_ENABLED

```
#define HAL_CAN_MODULE_ENABLED
```

Definition at line 42 of file stm32f4xx\_hal\_conf.h.

#### 7.20.2.11 HAL\_CORTEX\_MODULE\_ENABLED

```
#define HAL_CORTEX_MODULE_ENABLED
```

Definition at line 90 of file stm32f4xx\_hal\_conf.h.

#### 7.20.2.12 HAL\_DMA\_MODULE\_ENABLED

```
#define HAL_DMA_MODULE_ENABLED
```

Definition at line 86 of file stm32f4xx\_hal\_conf.h.

#### 7.20.2.13 HAL\_EXTI\_MODULE\_ENABLED

```
#define HAL_EXTI_MODULE_ENABLED
```

Definition at line 85 of file stm32f4xx\_hal\_conf.h.

#### 7.20.2.14 HAL\_FLASH\_MODULE\_ENABLED

```
#define HAL_FLASH_MODULE_ENABLED
```

Definition at line 88 of file stm32f4xx\_hal\_conf.h.

### 7.20.2.15 HAL\_GPIO\_MODULE\_ENABLED

```
#define HAL_GPIO_MODULE_ENABLED
```

Definition at line 84 of file stm32f4xx\_hal\_conf.h.

### 7.20.2.16 HAL\_MODULE\_ENABLED

```
#define HAL_MODULE_ENABLED
```

This is the list of modules to be used in the HAL driver.

Definition at line 38 of file stm32f4xx\_hal\_conf.h.

### 7.20.2.17 HAL\_PWR\_MODULE\_ENABLED

```
#define HAL_PWR_MODULE_ENABLED
```

Definition at line 89 of file stm32f4xx\_hal\_conf.h.

### 7.20.2.18 HAL\_RCC\_MODULE\_ENABLED

```
#define HAL_RCC_MODULE_ENABLED
```

Definition at line 87 of file stm32f4xx\_hal\_conf.h.

### 7.20.2.19 HAL\_SPI\_MODULE\_ENABLED

```
#define HAL_SPI_MODULE_ENABLED
```

Definition at line 65 of file stm32f4xx\_hal\_conf.h.

### 7.20.2.20 HAL\_TIM\_MODULE\_ENABLED

```
#define HAL_TIM_MODULE_ENABLED
```

Definition at line 66 of file stm32f4xx\_hal\_conf.h.

#### 7.20.2.21 HSE\_STARTUP\_TIMEOUT

```
#define HSE_STARTUP_TIMEOUT 100U
```

Time out for HSE start up, in ms

Definition at line 103 of file stm32f4xx\_hal\_conf.h.

#### 7.20.2.22 HSE\_VALUE

```
#define HSE_VALUE 8000000U
```

Adjust the value of External High Speed oscillator (HSE) used in your application. This value is used by the RCC HAL module to compute the system frequency (when HSE is used as system clock source, directly or through the PLL).

Value of the External oscillator in Hz

Definition at line 99 of file stm32f4xx\_hal\_conf.h.

#### 7.20.2.23 HSI\_VALUE

```
#define HSI_VALUE ((uint32_t)16000000U)
```

Internal High Speed oscillator (HSI) value. This value is used by the RCC HAL module to compute the system frequency (when HSI is used as system clock source, directly or through the PLL).

Value of the Internal oscillator in Hz

Definition at line 112 of file stm32f4xx\_hal\_conf.h.

#### 7.20.2.24 INSTRUCTION\_CACHE\_ENABLE

```
#define INSTRUCTION_CACHE_ENABLE 1U
```

Definition at line 154 of file stm32f4xx\_hal\_conf.h.

#### 7.20.2.25 LSE\_STARTUP\_TIMEOUT

```
#define LSE_STARTUP_TIMEOUT 5000U
```

Time out for LSE start up, in ms

Definition at line 131 of file stm32f4xx\_hal\_conf.h.

### 7.20.2.26 LSE\_VALUE

```
#define LSE_VALUE 32768U
```

External Low Speed oscillator (LSE) value.

< Value of the Internal Low Speed oscillator in Hz The real value may vary depending on the variations in voltage and temperature. Value of the External Low Speed oscillator in Hz

Definition at line 127 of file stm32f4xx\_hal\_conf.h.

### 7.20.2.27 LSI\_VALUE

```
#define LSI_VALUE 32000U
```

Internal Low Speed oscillator (LSI) value.

LSI Typical Value in Hz

Definition at line 119 of file stm32f4xx\_hal\_conf.h.

### 7.20.2.28 MAC\_ADDR0

```
#define MAC_ADDR0 2U
```

Uncomment the line below to expanse the "assert\_param" macro in the HAL drivers code.

Definition at line 209 of file stm32f4xx\_hal\_conf.h.

### 7.20.2.29 MAC\_ADDR1

```
#define MAC_ADDR1 0U
```

Definition at line 210 of file stm32f4xx\_hal\_conf.h.

### 7.20.2.30 MAC\_ADDR2

```
#define MAC_ADDR2 0U
```

Definition at line 211 of file stm32f4xx\_hal\_conf.h.

#### 7.20.2.31 MAC\_ADDR3

```
#define MAC_ADDR3 0U
```

Definition at line 212 of file stm32f4xx\_hal\_conf.h.

#### 7.20.2.32 MAC\_ADDR4

```
#define MAC_ADDR4 0U
```

Definition at line 213 of file stm32f4xx\_hal\_conf.h.

#### 7.20.2.33 MAC\_ADDR5

```
#define MAC_ADDR5 0U
```

Definition at line 214 of file stm32f4xx\_hal\_conf.h.

#### 7.20.2.34 PHY\_AUTONEGO\_COMPLETE

```
#define PHY_AUTONEGO_COMPLETE ((uint16_t)0x0020U)
```

Auto-Negotiation process completed

Definition at line 250 of file stm32f4xx\_hal\_conf.h.

#### 7.20.2.35 PHY\_AUTONEGOTIATION

```
#define PHY_AUTONEGOTIATION ((uint16_t)0x1000U)
```

Enable auto-negotiation function

Definition at line 245 of file stm32f4xx\_hal\_conf.h.

### 7.20.2.36 PHY\_BCR

```
#define PHY_BCR ((uint16_t)0x0000U)
```

Transceiver Basic Control Register

Definition at line 236 of file stm32f4xx\_hal\_conf.h.

### 7.20.2.37 PHY\_BSR

```
#define PHY_BSR ((uint16_t)0x0001U)
```

Transceiver Basic Status Register

Definition at line 237 of file stm32f4xx\_hal\_conf.h.

### 7.20.2.38 PHY\_CONFIG\_DELAY

```
#define PHY_CONFIG_DELAY 0x00000FFFU
```

Definition at line 229 of file stm32f4xx\_hal\_conf.h.

### 7.20.2.39 PHY\_DUPLEX\_STATUS

```
#define PHY_DUPLEX_STATUS ((uint16_t))
```

PHY Duplex mask

Definition at line 258 of file stm32f4xx\_hal\_conf.h.

### 7.20.2.40 PHY\_FULLDUPLEX\_100M

```
#define PHY_FULLDUPLEX_100M ((uint16_t)0x2100U)
```

Set the full-duplex mode at 100 Mb/s

Definition at line 241 of file stm32f4xx\_hal\_conf.h.

#### 7.20.2.41 PHY\_FULLDUPLEX\_10M

```
#define PHY_FULLDUPLEX_10M ((uint16_t)0x0100U)
```

Set the full-duplex mode at 10 Mb/s

Definition at line 243 of file stm32f4xx\_hal\_conf.h.

#### 7.20.2.42 PHY\_HALFDUPLEX\_100M

```
#define PHY_HALFDUPLEX_100M ((uint16_t)0x2000U)
```

Set the half-duplex mode at 100 Mb/s

Definition at line 242 of file stm32f4xx\_hal\_conf.h.

#### 7.20.2.43 PHY\_HALFDUPLEX\_10M

```
#define PHY_HALFDUPLEX_10M ((uint16_t)0x0000U)
```

Set the half-duplex mode at 10 Mb/s

Definition at line 244 of file stm32f4xx\_hal\_conf.h.

#### 7.20.2.44 PHY\_ISOLATE

```
#define PHY_ISOLATE ((uint16_t)0x0400U)
```

Isolate PHY from MII

Definition at line 248 of file stm32f4xx\_hal\_conf.h.

#### 7.20.2.45 PHY\_JABBER\_DETECTION

```
#define PHY_JABBER_DETECTION ((uint16_t)0x0002U)
```

Jabber condition detected

Definition at line 252 of file stm32f4xx\_hal\_conf.h.

#### 7.20.2.46 PHY\_LINKED\_STATUS

```
#define PHY_LINKED_STATUS ((uint16_t)0x0004U)
```

Valid link established

Definition at line 251 of file stm32f4xx\_hal\_conf.h.

#### 7.20.2.47 PHY\_LOOPBACK

```
#define PHY_LOOPBACK ((uint16_t)0x4000U)
```

Select loop-back mode

Definition at line 240 of file stm32f4xx\_hal\_conf.h.

#### 7.20.2.48 PHY\_POWERDOWN

```
#define PHY_POWERDOWN ((uint16_t)0x0800U)
```

Select the power down mode

Definition at line 247 of file stm32f4xx\_hal\_conf.h.

#### 7.20.2.49 PHY\_READ\_TO

```
#define PHY_READ_TO 0x0000FFFFU
```

Definition at line 231 of file stm32f4xx\_hal\_conf.h.

#### 7.20.2.50 PHY\_RESET

```
#define PHY_RESET ((uint16_t)0x8000U)
```

PHY Reset

Definition at line 239 of file stm32f4xx\_hal\_conf.h.

#### 7.20.2.51 PHY\_RESET\_DELAY

```
#define PHY_RESET_DELAY 0x000000FFU
```

Definition at line 227 of file stm32f4xx\_hal\_conf.h.

#### 7.20.2.52 PHY\_RESTART\_AUTONEGOTIATION

```
#define PHY_RESTART_AUTONEGOTIATION ((uint16_t)0x0200U)
```

Restart auto-negotiation function

Definition at line 246 of file stm32f4xx\_hal\_conf.h.

#### 7.20.2.53 PHY\_SPEED\_STATUS

```
#define PHY_SPEED_STATUS ((uint16_t))
```

PHY Speed mask

Definition at line 257 of file stm32f4xx\_hal\_conf.h.

#### 7.20.2.54 PHY\_SR

```
#define PHY_SR ((uint16_t))
```

PHY status register Offset

Definition at line 255 of file stm32f4xx\_hal\_conf.h.

#### 7.20.2.55 PHY\_WRITE\_TO

```
#define PHY_WRITE_TO 0x0000FFFFU
```

Definition at line 232 of file stm32f4xx\_hal\_conf.h.

### 7.20.2.56 PREFETCH\_ENABLE

```
#define PREFETCH_ENABLE 1U
```

Definition at line 153 of file stm32f4xx\_hal\_conf.h.

### 7.20.2.57 TICK\_INT\_PRIORITY

```
#define TICK_INT_PRIORITY 15U
```

tick interrupt priority

Definition at line 151 of file stm32f4xx\_hal\_conf.h.

### 7.20.2.58 USE\_HAL\_ADC\_REGISTER\_CALLBACKS

```
#define USE_HAL_ADC_REGISTER_CALLBACKS 0U /* ADC register callback disabled */
```

Definition at line 157 of file stm32f4xx\_hal\_conf.h.

### 7.20.2.59 USE\_HAL\_CAN\_REGISTER\_CALLBACKS

```
#define USE_HAL_CAN_REGISTER_CALLBACKS 0U /* CAN register callback disabled */
```

Definition at line 158 of file stm32f4xx\_hal\_conf.h.

### 7.20.2.60 USE\_HAL\_CEC\_REGISTER\_CALLBACKS

```
#define USE_HAL_CEC_REGISTER_CALLBACKS 0U /* CEC register callback disabled */
```

Definition at line 159 of file stm32f4xx\_hal\_conf.h.

### 7.20.2.61 USE\_HAL\_Cryp\_REGISTER\_CALLBACKS

```
#define USE_HAL_Cryp_REGISTER_CALLBACKS 0U /* CRYPT register callback disabled */
```

Definition at line 160 of file stm32f4xx\_hal\_conf.h.

### 7.20.2.62 USE\_HAL\_DAC\_REGISTER\_CALLBACKS

```
#define USE_HAL_DAC_REGISTER_CALLBACKS 0U /* DAC register callback disabled */
```

Definition at line 161 of file stm32f4xx\_hal\_conf.h.

### 7.20.2.63 USE\_HAL\_DCMI\_REGISTER\_CALLBACKS

```
#define USE_HAL_DCMI_REGISTER_CALLBACKS 0U /* DCMI register callback disabled */
```

Definition at line 162 of file stm32f4xx\_hal\_conf.h.

### 7.20.2.64 USE\_HAL\_DFSDM\_REGISTER\_CALLBACKS

```
#define USE_HAL_DFSDM_REGISTER_CALLBACKS 0U /* DFSDM register callback disabled */
```

Definition at line 163 of file stm32f4xx\_hal\_conf.h.

### 7.20.2.65 USE\_HAL\_DMA2D\_REGISTER\_CALLBACKS

```
#define USE_HAL_DMA2D_REGISTER_CALLBACKS 0U /* DMA2D register callback disabled */
```

Definition at line 164 of file stm32f4xx\_hal\_conf.h.

### 7.20.2.66 USE\_HAL\_DSI\_REGISTER\_CALLBACKS

```
#define USE_HAL_DSI_REGISTER_CALLBACKS 0U /* DSI register callback disabled */
```

Definition at line 165 of file stm32f4xx\_hal\_conf.h.

### 7.20.2.67 USE\_HAL\_ETH\_REGISTER\_CALLBACKS

```
#define USE_HAL_ETH_REGISTER_CALLBACKS 0U /* ETH register callback disabled */
```

Definition at line 166 of file stm32f4xx\_hal\_conf.h.

### 7.20.2.68 USE\_HAL\_FMPI2C\_REGISTER\_CALLBACKS

```
#define USE_HAL_FMPI2C_REGISTER_CALLBACKS 0U /* FMPI2C register callback disabled */
```

Definition at line 170 of file stm32f4xx\_hal\_conf.h.

### 7.20.2.69 USE\_HAL\_FMPMBUS\_REGISTER\_CALLBACKS

```
#define USE_HAL_FMPMBUS_REGISTER_CALLBACKS 0U /* FMPMBUS register callback disabled */
```

Definition at line 171 of file stm32f4xx\_hal\_conf.h.

### 7.20.2.70 USE\_HAL\_HASH\_REGISTER\_CALLBACKS

```
#define USE_HAL_HASH_REGISTER_CALLBACKS 0U /* HASH register callback disabled */
```

Definition at line 167 of file stm32f4xx\_hal\_conf.h.

### 7.20.2.71 USE\_HAL\_HCD\_REGISTER\_CALLBACKS

```
#define USE_HAL_HCD_REGISTER_CALLBACKS 0U /* HCD register callback disabled */
```

Definition at line 168 of file stm32f4xx\_hal\_conf.h.

### 7.20.2.72 USE\_HAL\_I2C\_REGISTER\_CALLBACKS

```
#define USE_HAL_I2C_REGISTER_CALLBACKS 0U /* I2C register callback disabled */
```

Definition at line 169 of file stm32f4xx\_hal\_conf.h.

### 7.20.2.73 USE\_HAL\_I2S\_REGISTER\_CALLBACKS

```
#define USE_HAL_I2S_REGISTER_CALLBACKS 0U /* I2S register callback disabled */
```

Definition at line 172 of file stm32f4xx\_hal\_conf.h.

#### 7.20.2.74 USE\_HAL\_IRDA\_REGISTER\_CALLBACKS

```
#define USE_HAL_IRDA_REGISTER_CALLBACKS 0U /* IRDA register callback disabled */
```

Definition at line 173 of file stm32f4xx\_hal\_conf.h.

#### 7.20.2.75 USE\_HAL\_LPTIM\_REGISTER\_CALLBACKS

```
#define USE_HAL_LPTIM_REGISTER_CALLBACKS 0U /* LPTIM register callback disabled */
```

Definition at line 174 of file stm32f4xx\_hal\_conf.h.

#### 7.20.2.76 USE\_HAL\_LTDC\_REGISTER\_CALLBACKS

```
#define USE_HAL_LTDC_REGISTER_CALLBACKS 0U /* LTDC register callback disabled */
```

Definition at line 175 of file stm32f4xx\_hal\_conf.h.

#### 7.20.2.77 USE\_HAL\_MMC\_REGISTER\_CALLBACKS

```
#define USE_HAL_MMC_REGISTER_CALLBACKS 0U /* MMC register callback disabled */
```

Definition at line 176 of file stm32f4xx\_hal\_conf.h.

#### 7.20.2.78 USE\_HAL\_NAND\_REGISTER\_CALLBACKS

```
#define USE_HAL_NAND_REGISTER_CALLBACKS 0U /* NAND register callback disabled */
```

Definition at line 177 of file stm32f4xx\_hal\_conf.h.

#### 7.20.2.79 USE\_HAL\_NOR\_REGISTER\_CALLBACKS

```
#define USE_HAL_NOR_REGISTER_CALLBACKS 0U /* NOR register callback disabled */
```

Definition at line 178 of file stm32f4xx\_hal\_conf.h.

#### 7.20.2.80 USE\_HAL\_PCCARD\_REGISTER\_CALLBACKS

```
#define USE_HAL_PCCARD_REGISTER_CALLBACKS 0U /* PCCARD register callback disabled */
```

Definition at line 179 of file stm32f4xx\_hal\_conf.h.

#### 7.20.2.81 USE\_HAL\_PCD\_REGISTER\_CALLBACKS

```
#define USE_HAL_PCD_REGISTER_CALLBACKS 0U /* PCD register callback disabled */
```

Definition at line 180 of file stm32f4xx\_hal\_conf.h.

#### 7.20.2.82 USE\_HAL\_QSPI\_REGISTER\_CALLBACKS

```
#define USE_HAL_QSPI_REGISTER_CALLBACKS 0U /* QSPI register callback disabled */
```

Definition at line 181 of file stm32f4xx\_hal\_conf.h.

#### 7.20.2.83 USE\_HAL\_RNG\_REGISTER\_CALLBACKS

```
#define USE_HAL_RNG_REGISTER_CALLBACKS 0U /* RNG register callback disabled */
```

Definition at line 182 of file stm32f4xx\_hal\_conf.h.

#### 7.20.2.84 USE\_HAL\_RTC\_REGISTER\_CALLBACKS

```
#define USE_HAL_RTC_REGISTER_CALLBACKS 0U /* RTC register callback disabled */
```

Definition at line 183 of file stm32f4xx\_hal\_conf.h.

#### 7.20.2.85 USE\_HAL\_SAI\_REGISTER\_CALLBACKS

```
#define USE_HAL_SAI_REGISTER_CALLBACKS 0U /* SAI register callback disabled */
```

Definition at line 184 of file stm32f4xx\_hal\_conf.h.

### 7.20.2.86 USE\_HAL\_SD\_REGISTER\_CALLBACKS

```
#define USE_HAL_SD_REGISTER_CALLBACKS 0U /* SD register callback disabled */
```

Definition at line 185 of file stm32f4xx\_hal\_conf.h.

### 7.20.2.87 USE\_HAL\_SDRAM\_REGISTER\_CALLBACKS

```
#define USE_HAL_SDRAM_REGISTER_CALLBACKS 0U /* SDRAM register callback disabled */
```

Definition at line 187 of file stm32f4xx\_hal\_conf.h.

### 7.20.2.88 USE\_HAL\_SMARTCARD\_REGISTER\_CALLBACKS

```
#define USE_HAL_SMARTCARD_REGISTER_CALLBACKS 0U /* SMARTCARD register callback disabled */
```

Definition at line 186 of file stm32f4xx\_hal\_conf.h.

### 7.20.2.89 USE\_HAL\_SMBUS\_REGISTER\_CALLBACKS

```
#define USE_HAL_SMBUS_REGISTER_CALLBACKS 0U /* SMBUS register callback disabled */
```

Definition at line 190 of file stm32f4xx\_hal\_conf.h.

### 7.20.2.90 USE\_HAL\_SPDIFRX\_REGISTER\_CALLBACKS

```
#define USE_HAL_SPDIFRX_REGISTER_CALLBACKS 0U /* SPDIFRX register callback disabled */
```

Definition at line 189 of file stm32f4xx\_hal\_conf.h.

### 7.20.2.91 USE\_HAL\_SPI\_REGISTER\_CALLBACKS

```
#define USE_HAL_SPI_REGISTER_CALLBACKS 0U /* SPI register callback disabled */
```

Definition at line 191 of file stm32f4xx\_hal\_conf.h.

### 7.20.2.92 USE\_HAL\_SRAM\_REGISTER\_CALLBACKS

```
#define USE_HAL_SRAM_REGISTER_CALLBACKS 0U /* SRAM register callback disabled */
```

Definition at line 188 of file stm32f4xx\_hal\_conf.h.

### 7.20.2.93 USE\_HAL\_TIM\_REGISTER\_CALLBACKS

```
#define USE_HAL_TIM_REGISTER_CALLBACKS 0U /* TIM register callback disabled */
```

Definition at line 192 of file stm32f4xx\_hal\_conf.h.

### 7.20.2.94 USE\_HAL\_UART\_REGISTER\_CALLBACKS

```
#define USE_HAL_UART_REGISTER_CALLBACKS 0U /* UART register callback disabled */
```

Definition at line 193 of file stm32f4xx\_hal\_conf.h.

### 7.20.2.95 USE\_HAL\_USART\_REGISTER\_CALLBACKS

```
#define USE_HAL_USART_REGISTER_CALLBACKS 0U /* USART register callback disabled */
```

Definition at line 194 of file stm32f4xx\_hal\_conf.h.

### 7.20.2.96 USE\_HAL\_WWDG\_REGISTER\_CALLBACKS

```
#define USE_HAL_WWDG_REGISTER_CALLBACKS 0U /* WWDG register callback disabled */
```

Definition at line 195 of file stm32f4xx\_hal\_conf.h.

### 7.20.2.97 USE\_RTOS

```
#define USE_RTOS 0U
```

Definition at line 152 of file stm32f4xx\_hal\_conf.h.

### 7.20.2.98 USE\_SPI\_CRC

```
#define USE_SPI_CRC 0U
```

Definition at line 267 of file stm32f4xx\_hal\_conf.h.

### 7.20.2.99 VDD\_VALUE

```
#define VDD_VALUE 3300U
```

This is the HAL system configuration section.

Value of VDD in mv

Definition at line 150 of file stm32f4xx\_hal\_conf.h.

## 7.21 Core/Inc/stm32f4xx\_it.h File Reference

This file contains the headers of the interrupt handlers.

### Functions

- void [NMI\\_Handler](#) (void)  
*This function handles Non maskable interrupt.*
- void [HardFault\\_Handler](#) (void)  
*This function handles Hard fault interrupt.*
- void [MemManage\\_Handler](#) (void)  
*This function handles Memory management fault.*
- void [BusFault\\_Handler](#) (void)  
*This function handles Pre-fetch fault, memory access fault.*
- void [UsageFault\\_Handler](#) (void)  
*This function handles Undefined instruction or illegal state.*
- void [DebugMon\\_Handler](#) (void)  
*This function handles Debug monitor.*
- void [EXTI0\\_IRQHandler](#) (void)  
*This function handles EXTI line0 interrupt.*
- void [TIM1\\_UP\\_TIM10\\_IRQHandler](#) (void)  
*This function handles TIM1 update interrupt and TIM10 global interrupt.*
- void [DMA2\\_Stream0\\_IRQHandler](#) (void)  
*This function handles DMA2 stream0 global interrupt.*
- void [CAN2\\_TX\\_IRQHandler](#) (void)  
*This function handles CAN2 TX interrupts.*
- void [CAN2\\_RX0\\_IRQHandler](#) (void)  
*This function handles CAN2 RX0 interrupts.*
- void [CAN2\\_RX1\\_IRQHandler](#) (void)  
*This function handles CAN2 RX1 interrupt.*

### 7.21.1 Detailed Description

This file contains the headers of the interrupt handlers.

### 7.21.2 Function Documentation

#### 7.21.2.1 BusFault\_Handler()

```
void BusFault_Handler (  
    void )
```

This function handles Pre-fetch fault, memory access fault.

Definition at line 117 of file stm32f4xx\_it.c.

#### 7.21.2.2 CAN2\_RX0\_IRQHandler()

```
void CAN2_RX0_IRQHandler (  
    void )
```

This function handles CAN2 RX0 interrupts.

Definition at line 223 of file stm32f4xx\_it.c.

References hcan2.

#### 7.21.2.3 CAN2\_RX1\_IRQHandler()

```
void CAN2_RX1_IRQHandler (  
    void )
```

This function handles CAN2 RX1 interrupt.

Definition at line 237 of file stm32f4xx\_it.c.

References hcan2.

#### 7.21.2.4 CAN2\_TX\_IRQHandler()

```
void CAN2_TX_IRQHandler (
    void )
```

This function handles CAN2 TX interrupts.

Definition at line 209 of file stm32f4xx\_it.c.

References hcan2.

#### 7.21.2.5 DebugMon\_Handler()

```
void DebugMon_Handler (
    void )
```

This function handles Debug monitor.

Definition at line 147 of file stm32f4xx\_it.c.

#### 7.21.2.6 DMA2\_Stream0\_IRQHandler()

```
void DMA2_Stream0_IRQHandler (
    void )
```

This function handles DMA2 stream0 global interrupt.

Definition at line 195 of file stm32f4xx\_it.c.

References hdma\_adc1.

#### 7.21.2.7 EXTI0\_IRQHandler()

```
void EXTI0_IRQHandler (
    void )
```

This function handles EXTI line0 interrupt.

Definition at line 167 of file stm32f4xx\_it.c.

References Start\_Button\_Input\_Pin.

### 7.21.2.8 HardFault\_Handler()

```
void HardFault_Handler (
    void )
```

This function handles Hard fault interrupt.

Definition at line 87 of file stm32f4xx\_it.c.

### 7.21.2.9 MemManage\_Handler()

```
void MemManage_Handler (
    void )
```

This function handles Memory management fault.

Definition at line 102 of file stm32f4xx\_it.c.

### 7.21.2.10 NMI\_Handler()

```
void NMI_Handler (
    void )
```

This function handles Non maskable interrupt.

Definition at line 72 of file stm32f4xx\_it.c.

### 7.21.2.11 TIM1\_UP\_TIM10\_IRQHandler()

```
void TIM1_UP_TIM10_IRQHandler (
    void )
```

This function handles TIM1 update interrupt and TIM10 global interrupt.

Definition at line 181 of file stm32f4xx\_it.c.

References htim1.

### 7.21.2.12 UsageFault\_Handler()

```
void UsageFault_Handler (
    void )
```

This function handles Undefined instruction or illegal state.

Definition at line 132 of file stm32f4xx\_it.c.

## 7.22 Core/Inc/temp\_monitoring.h File Reference

```
#include "uvfr_utils.h"
```

### Functions

- [uv\\_status](#) [initTempMonitor](#) (void \*args)
- void [tempMonitorTask](#) (void \*args)

*Monitors the temperatures of various points in the tractive system, and activates various cooling systems and such accordingly.*

### 7.22.1 Function Documentation

#### 7.22.1.1 [initTempMonitor\(\)](#)

```
uv_status initTempMonitor (
    void * args )
```

Definition at line 12 of file temp\_monitoring.c.

References [\\_UV\\_DEFAULT\\_TASK\\_STACK\\_SIZE](#), [uv\\_task\\_info::active\\_states](#), [uv\\_task\\_info::deletion\\_states](#), [PROGRAMMING](#), [uv\\_task\\_info::stack\\_size](#), [uv\\_task\\_info::suspension\\_states](#), [uv\\_task\\_info::task\\_args](#), [uv\\_task\\_info::task\\_function](#), [uv\\_task\\_info::task\\_name](#), [uv\\_task\\_info::task\\_period](#), [uv\\_task\\_info::task\\_priority](#), [tempMonitorTask\(\)](#), [UV\\_DRIVING](#), [UV\\_ERROR](#), [UV\\_ERROR\\_STATE](#), [UV\\_LAUNCH\\_CONTROL](#), [UV\\_OK](#), [UV\\_READY](#), and [uvCreateTask\(\)](#).

Referenced by [uvInitStateEngine\(\)](#).

#### 7.22.1.2 [tempMonitorTask\(\)](#)

```
void tempMonitorTask (
    void * args )
```

Monitors the temperatures of various points in the tractive system, and activates various cooling systems and such accordingly.

Atm, this is mostly serving as an example of a task These here lines set the delay. This task executes exactly at the period specified, regardless of how long the task execution actually takes

```
*/
TickType_t tick_period = pdMS_TO_TICKS(params->task_period); //Convert ms of period to the RTOS ticks
TickType_t last_time = 0;
/**
```

This is an example of a task control point, which is the spot in the task where the task decides what needs to be done, based on the commands it has received from the task manager and the SCD

Definition at line 70 of file temp\_monitoring.c.

## Typedefs

- `typedef enum uv_status_t uv_status`
- `typedef uint8_t uv_task_id`
- `typedef uint32_t uv_timespan_ms`
- `typedef enum uv_vehicle_state_t uv_vehicle_state`  
*Type representing the overall state and operating mode of the vehicle.*
- `typedef enum uv_task_cmd_e uv_task_cmd`  
*Special commands used to start and shutdown tasks.*
- `typedef struct uv_scd_response uv_scd_response`
- `typedef enum uv_task_state_t uv_task_status`  
*Enum representing the state of a managed task.*
- `typedef enum task_priority task_priority`

- *Priority of a managed task. Maps directly to OS priority.*
- typedef struct [task\\_management\\_info](#) [task\\_management\\_info](#)  
*Struct to contain data about a parent task.*
- typedef struct [task\\_status\\_block](#) [task\\_status\\_block](#)  
*Information about the task.*
- typedef struct [uv\\_os\\_settings](#) [uv\\_os\\_settings](#)  
*Settings that dictate state engine behavior.*
- typedef struct [uv\\_task\\_info](#) [uv\\_task\\_info](#)  
*This struct is designed to hold neccessary information about an RTOS task that will be managed by uvfr\_state\_↔ engine.*

## Enumerations

- enum [uv\\_vehicle\\_state\\_t](#) {  
  [UV\\_INIT](#) = 0x0001, [UV\\_READY](#) = 0x0002, [PROGRAMMING](#) = 0x0004, [UV\\_DRIVING](#) = 0x0008,  
  [UV\\_SUSPENDED](#) = 0x0010, [UV\\_LAUNCH\\_CONTROL](#) = 0x0020, [UV\\_ERROR\\_STATE](#) = 0x0040,  
  [UV\\_BOOT](#) = 0x0080,  
  [UV\\_HALT](#) = 0x0100 }  
*Type representing the overall state and operating mode of the vehicle.*
- enum [uv\\_task\\_cmd\\_e](#) { [UV\\_NO\\_CMD](#), [UV\\_KILL\\_CMD](#), [UV\\_SUSPEND\\_CMD](#), [UV\\_TASK\\_START\\_CMD](#) }  
*Special commands used to start and shutdown tasks.*
- enum [uv\\_scd\\_response\\_e](#) {  
  [UV\\_SUCCESSFUL\\_DELETION](#), [UV\\_SUCCESSFUL\\_SUSPENSION](#), [UV\\_COULDNT\\_DELETE](#), [UV\\_COULDNT\\_SUSPEND](#),  
  [UV\\_UNSAFE\\_STATE](#) }  
*Response from a task confirming it has been either deleted or suspended.*
- enum [uv\\_task\\_state\\_t](#) { [UV\\_TASK\\_NOT\\_STARTED](#), [UV\\_TASK\\_DELETED](#), [UV\\_TASK\\_RUNNING](#),  
  [UV\\_TASK\\_SUSPENDED](#) }  
*Enum representing the state of a managed task.*
- enum [task\\_priority](#) {  
  [IDLE\\_TASK\\_PRIORITY](#), [LOW\\_PRIORITY](#), [BELOW\\_NORMAL](#), [MEDIUM\\_PRIORITY](#),  
  [ABOVE\\_NORMAL](#), [HIGH\\_PRIORITY](#), [REALTIME\\_PRIORITY](#) }  
*Priority of a managed task. Maps directly to OS priority.*

## Functions

- struct [uv\\_task\\_info](#) \* [uvCreateTask](#) ()  
*This function gets called when you want to create a task, and register it with the task register. Theres some gnarliness here, but not unacceptable levels. Pray this thing doesn't hang itself.*
- struct [uv\\_task\\_info](#) \* [uvCreateServiceTask](#) ()  
*Create a new service task, because fuck you, thats why.*
- struct [uv\\_task\\_info](#) \* [uvGetTaskById](#) (uint8\_t id)
- [uv\\_status](#) [uvValidateSpecificTask](#) (uint8\_t id)  
*make sure the parameters of a task\_info struct is valid*
- [uv\\_status](#) [uvValidateManagedTasks](#) ()  
*ensure that all the tasks people have created actually make sense, and are valid*
- [uv\\_status](#) [uvStartTask](#) (uint32\_t \*tracker, struct [uv\\_task\\_info](#) \*t)  
*: This is a function that starts tasks which are already registered in the system*
- [uv\\_status](#) [uvRegisterTask](#) ()
- [uv\\_status](#) [uvInitStateEngine](#) ()  
*Function that prepares the state engine to do its thing.*
- [uv\\_status](#) [uvStartStateMachine](#) ()

- Actually starts up the state engine to do state engine things.*

  - `uv_status uvDeleteTask` (`uint32_t *tracker`, `struct uv_task_info *t`)  
*deletes a managed task via the system*
  - `uv_status uvSuspendTask` (`uint32_t *tracker`, `struct uv_task_info *t`)  
*function to suspend one of the managed tasks.*
  - `uv_status uvDeInitStateEngine` ()  
*Stops and frees all resources used by uvfr\_state\_engine.*
  - `uv_status updateRunningTasks` ()
  - `uv_status changeVehicleState` (`uint16_t state`)  
*Function for changing the state of the vehicle, as well as the list of active + inactive tasks.*
  - `void __uvPanic` (`char *msg`, `uint8_t msg_len`, `const char *file`, `const int line`, `const char *func`)  
*Something bad has occurred here now we in trouble.*
  - `void killSelf` (`struct uv_task_info *t`)  
*This function is called by a task to nuke itself. Is a wrapper function that is used to do all the different things.*
  - `void suspendSelf` (`struct uv_task_info *t`)  
*Called by a task that needs to suspend itself, once the task has determined it is safe to do so.*
  - `uv_task_id getSVCTaskID` (`char *tsk_name`)

## Variables

- enum `uv_vehicle_state_t vehicle_state`

## 7.26.1 Macro Definition Documentation

### 7.26.1.1 \_LONGEST\_SC\_TIME

```
#define _LONGEST_SC_TIME 300
```

Definition at line 63 of file `uvfr_state_engine.h`.

### 7.26.1.2 \_SC\_DAEMON\_PERIOD

```
#define _SC_DAEMON_PERIOD 10
```

Definition at line 64 of file `uvfr_state_engine.h`.

*Enum dictating the meaning of a generic message.*

## Functions

- void [uvInit](#) (void \*arguments)  
: Function that initializes all of the car's stuff.
- void [\\_\\_uvInitPanic](#) ()  
Low Level Panic, that does not require the full UVFR utils functionality to be operational.
- [uv\\_status](#) [uvIsPTRValid](#) (void \*ptr)  
function that checks to make sure a pointer points to a place it is allowed to point to

## Variables

- [uv\\_internal\\_params](#) [global\\_context](#)

### 7.27.1 Detailed Description

Author

Byron Oser

### 7.27.2 Macro Definition Documentation

#### 7.27.2.1 INIT\_CHECK\_PERIOD

```
#define INIT_CHECK_PERIOD 100
```

Definition at line 146 of file uvfr\_utils.h.

#### 7.27.2.2 MAX\_INIT\_TIME

```
#define MAX_INIT_TIME 2500
```

Definition at line 145 of file uvfr\_utils.h.

#### 7.27.2.3 USE\_OLED\_DEBUG

```
#define USE_OLED_DEBUG 1
```

Definition at line 157 of file uvfr\_utils.h.

#### 7.27.2.4 UV\_CAN1

```
#define UV_CAN1
```

Definition at line 153 of file uvfr\_utils.h.

#### 7.27.2.5 UV\_CAN2

```
#define UV_CAN2
```

Definition at line 154 of file uvfr\_utils.h.

### 7.27.2.6 UV\_CAN\_CHANNEL\_MASK

```
#define UV_CAN_CHANNEL_MASK 0b00000110
```

Definition at line 263 of file uvfr\_utils.h.

### 7.27.2.7 UV\_CAN\_DYNAMIC\_MEM

```
#define UV_CAN_DYNAMIC_MEM 0b00001000
```

Definition at line 264 of file uvfr\_utils.h.

### 7.27.2.8 UV\_CAN\_EXTENDED\_ID

```
#define UV_CAN_EXTENDED_ID 0x01
```

Definition at line 262 of file uvfr\_utils.h.

## 7.27.3 Typedef Documentation

### 7.27.3.1 access\_control\_info

```
typedef union access_control_info access_control_info
```

### 7.27.3.2 access\_control\_type

```
typedef enum access_control_t access_control_type
```

### 7.27.3.3 bool

```
typedef uint8_t bool
```

Definition at line 134 of file uvfr\_utils.h.

#### 7.27.3.4 p\_status

```
typedef struct p_status p_status
```

#### 7.27.3.5 uv\_CAN\_msg

```
typedef struct uv_CAN_msg uv_CAN_msg
```

Representative of a CAN message.

#### 7.27.3.6 uv\_ext\_device\_id

```
typedef uint8_t uv_ext_device_id
```

Definition at line 138 of file uvfr\_utils.h.

#### 7.27.3.7 uv\_init\_struct

```
typedef struct uv_init_struct uv_init_struct
```

contains info relevant to initializing the vehicle

#### 7.27.3.8 uv\_init\_task\_args

```
typedef struct uv_init_task_args uv_init_task_args
```

Struct designed to act like the `uv_task_info` struct, but for the initialisation tasks. As a result it takes fewer arguments.

#### 7.27.3.9 uv\_init\_task\_response

```
typedef struct uv_init_task_response uv_init_task_response
```

Struct representing the response of one of the initialization tasks.

Is returned in the initialization queue, and is read by `uvInit()` to determine whether the initialization of the internal device has failed or succeeded.

### 7.27.3.10 uv\_internal\_params

```
typedef struct uv_internal_params uv_internal_params
```

Data used by the uvfr\_utils library to do what it needs to do :)

This is a global variable that is initialized at some point at launch

### 7.27.3.11 uv\_msg\_type

```
typedef enum uv_msg_type_t uv_msg_type
```

Enum dictating the meaning of a generic message.

### 7.27.3.12 uv\_status

```
typedef enum uv_status_t uv_status
```

This is meant to be a return type from functions that indicates what is actually going on.

Use this as a return value for functions you want to know the success of. In general, any function you write must return something, as well as account for any possible errors that may have occurred.

### 7.27.3.13 uv\_task\_cmd

```
typedef enum uv_task_cmd_e uv_task_cmd
```

Definition at line 136 of file uvfr\_utils.h.

### 7.27.3.14 uv\_task\_id

```
typedef uint8_t uv_task_id
```

Definition at line 135 of file uvfr\_utils.h.

### 7.27.3.15 uv\_task\_msg

```
typedef struct uv_task_msg_t uv_task_msg
```

Struct containing a message between two tasks.

This is a generic type that is best used in situations where the message could mean a variety of different things. For niche applications or where efficiency is paramount, we recommend creating a bespoke protocol.

### 7.27.3.16 uv\_timespan\_ms

```
typedef uint32_t uv_timespan_ms
```

Definition at line 139 of file uvfr\_utils.h.

## 7.27.4 Enumeration Type Documentation

### 7.27.4.1 access\_control\_t

```
enum access_control_t
```

Enumerator

UV_NONE	
UV_DUMB_FLAG	
UV_MUTEX	
UV_BINARY_SEMAPHORE	
UV_SEMAPHORE	

Definition at line 211 of file uvfr\_utils.h.

### 7.27.4.2 data\_type

```
enum data_type
```

Represents the data type of some variable.

Enumerator

UV_UINT8	
UV_INT8	
UV_UINT16	
UV_INT16	
UV_UINT32	
UV_INT32	
UV_FLOAT	
UV_DOUBLE	
UV_INT64	
UV_UINT64	
UV_STRING	

Definition at line 177 of file uvfr\_utils.h.

### 7.27.4.3 uv\_driving\_mode\_t

enum `uv_driving_mode_t`

Enumerator

normal	
accel	
econ	
limp	

Definition at line 194 of file `uvfr_utils.h`.

### 7.27.4.4 uv\_external\_device

enum `uv_external_device`

ID for external devices, which allows us to know what's good with them.

Enumerator

MOTOR_CONTROLLER	
BMS	
IMD	
PDU	

Definition at line 204 of file `uvfr_utils.h`.

### 7.27.4.5 uv\_msg\_type\_t

enum `uv_msg_type_t`

Enum dictating the meaning of a generic message.

Enumerator

UV_TASK_START_COMMAND	
UV_TASK_DELETE_COMMAND	
UV_TASK_SUSPEND_COMMAND	
UV_COMMAND_ACKNOWLEDGEMENT	
UV_TASK_STATUS_REPORT	
UV_ERROR_REPORT	
UV_WAKEUP	

Enumerator

UV_PARAM_REQUEST	
UV_PARAM_READY	
UV_RAW_DATA_TRANSFER	
UV_SC_COMMAND	
UV_INVALID_MSG	
UV_ASSIGN_TASK	

Definition at line 222 of file uvfr\_utils.h.

#### 7.27.4.6 uv\_status\_t

```
enum uv_status_t
```

This is meant to be a return type from functions that indicates what is actually going on.

Use this as a return value for functions you want to know the success of. In general, any function you write must return something, as well as account for any possible errors that may have occurred.

Enumerator

UV_OK	
UV_WARNING	
UV_ERROR	
UV_ABORTED	

Definition at line 166 of file uvfr\_utils.h.

### 7.27.5 Function Documentation

#### 7.27.5.1 \_\_uvInitPanic()

```
void __uvInitPanic ( )
```

Low Level Panic, that does not require the full UVFR utils functionality to be operational.

Attention

Calling `_uvInitPanic()` is irreversable and will cause the vehicle to hang itself. This is only to be used as a last resort to stop the vehicle from entering an invalid state.

Definition at line 271 of file uvfr\_utils.c.

Referenced by `uvInit()`, `uvInitStateEngine()`, and `uvSVCTaskManager()`.

### 7.27.5.2 uvInit()

```
void uvInit (
    void * arguments )
```

: Function that initializes all of the car's stuff.

This is an RTOS task, and it serves to setup all of the car's different functions. at this point in our execution, we have already initialized all of our favorite hardware peripherals using HAL. Now we get to configure our convoluted system of OS-level settings and state machines.

It executes the following functions, in order:

- Load Vehicle Settings
- Initialize and Start State Machine
- Start Service Tasks, such as CAN, ADC, etc...
- Initialize External Devices such as BMS, IMD, Motor Controller
- Validate that these devices have actually booted up
- Set vehicle state to UV\_READY

Pretty important shit if you ask me.

First on the block is our settings. The uv\_settings are a bit strange, in the following way. We will check if we have saved custom settings, or if these settings are the default or not. It will then perform a checksum on the settings, and validate them to ensure they are safe. If it fails to validate the settings, it will attempt to return to factory default.

If it is unable to return even to factory default settings, then we are in HUGE trouble, and some catastrophic bug has occurred. If it fails to even start this, it will not be safe to drive. We must therefore panic.

Next up we will attempt to initialize the state engine. If this fails, then we are in another case where we are genuinely unsafe to drive. This will create the prototypes for a bajillion tasks that will be started and stopped. Which tasks are currently running, depends on the whims of the state engine. Since the state engine is critical to our ability to handle errors and implausibilities, we cannot proceed without a fully operational state engine.

Once the state machine is initialized we get to actually start the thing.

Once we have initialized the state engine, what we want to do is create the prototypes of all the tasks that will be running.

Now we are going to create a bunch of tasks that will initialize our car's external devices. The reason that these are RTOS tasks, is that it takes a buncha time to verify the existence of some devices. As a direct result, we can sorta just wait around and check that each task sends a message confirming that it has successfully executed. :) However, first we need to actually create a Queue for these tasks to use

```
/*
QueueHandle_t init_validation_queue = xQueueCreate(8, sizeof(uv_init_task_response));
if (init_validation_queue == NULL) {
    __uvInitPanic();
}
```

The next big thing on our plate is checking the status of all external devices we need, and initializing them with appropriate parameters. These are split into tasks because it takes a bit of time, especially for devices that need to be configured via CANBus such as the motor controller. That is why it is split the way it is, to allow these to run somewhat concurrently

```
*/
BaseType_t retval;
//osThreadDef_t MC_init_thread = {"MC_init", MC_Startup, osPriorityNormal, 128, 0};
uv_init_task_args* MC_init_args = uvMalloc(sizeof(uv_init_task_args));
MC_init_args->init_info_queue = init_validation_queue;
```

```
MC_init_args->specific_args = &(current_vehicle_settings->mc_settings);
//MC_init_args->meta_task_handle = osThreadCreate(&MC_init_thread,MC_init_args);
//vTaskResume( MC_init_args->meta_task_handle );
retval =
    xTaskCreate(MC_Startup,"MC_init",128,MC_init_args,osPriorityAboveNormal,&(MC_init_args->meta_task_handle));
if (retval != pdPASS){
    //FUCK
    error_msg = "bruh";
}
```

This thread is for initializing the BMS

```
*/
//osThreadDef_t BMS_init_thread = {"BMS_init",BMS_Init,osPriorityNormal,128,0};
uv_init_task_args* BMS_init_args = uvMalloc(sizeof(uv_init_task_args));
BMS_init_args->init_info_queue = init_validation_queue;
BMS_init_args->specific_args = &(current_vehicle_settings->bms_settings);
//BMS_init_args->meta_task_handle = osThreadCreate(&BMS_init_thread,BMS_init_args);
retval =
    xTaskCreate(BMS_Init,"BMS_init",128,BMS_init_args,osPriorityAboveNormal,&(BMS_init_args->meta_task_handle));
if (retval != pdPASS){
    //FUCK
    error_msg = "bruh";
}
```

This variable is a tracker that tracks which devices have successfully initialized

```
*/
uv_init_task_args* IMD_init_args = uvMalloc(sizeof(uv_init_task_args));
IMD_init_args->init_info_queue = init_validation_queue;
IMD_init_args->specific_args = &(current_vehicle_settings->imd_settings);
retval =
    xTaskCreate(initIMD,"BMS_init",128,IMD_init_args,osPriorityAboveNormal,&(IMD_init_args->meta_task_handle));
if (retval != pdPASS){
    //FUCK
    error_msg = "bruh";
}
uv_init_task_args* PDU_init_args = uvMalloc(sizeof(uv_init_task_args));
PDU_init_args->init_info_queue = init_validation_queue;
PDU_init_args->specific_args = &(current_vehicle_settings->imd_settings);
retval =
    xTaskCreate(initPDU,"PDU_init",128,PDU_init_args,osPriorityAboveNormal,&(PDU_init_args->meta_task_handle));
//pass in the right settings, dum dum
if (retval != pdPASS){
    //FUCK
    error_msg = "bruh";
}
uint16_t ext_devices_status = 0x000F; //Tracks which devices are currently setup
```

Wait for all the spawned in tasks to do their thing. This should not take that long, but we wanna be sure that everything is chill If we are say, missing a BMS, then it will not allow you to proceed past the initialisation step This is handled by a message buffer, that takes inputs from all of the tasks

We allocate space for a response from the initialization.

Clean up, clean up, everybody clean up, clean up, clean up, everybody do your share! The following code cleans up all the threads that were running, and free up used memory

### 7.27.5.3 uvIsPTRValid()

```
uv_status uvIsPTRValid (
    void * ptr )
```

function that checks to make sure a pointer points to a place it is allowed to point to

The primary motivation for this is to avoid trying to dereference a pointer that doesn't exist, and triggering the `HardFaultHandler()`. That is never a fun time. This allows us to exit gracefully instead of getting stuck in an IRQ handler

Exiting gracefully can be pretty neat sometimes.

Definition at line 401 of file `uvfr_utils.c`.

References `UV_ERROR`, `UV_OK`, and `UV_WARNING`.

Referenced by `__uvFreeCriticalSection()`, `__uvFreeOS()`, and `__uvMallocOS()`.

### 7.29.2 Function Documentation

#### 7.29.2.1 HAL\_ADC\_MspDeInit()

```
void HAL_ADC_MspDeInit (
    ADC_HandleTypeDef * adcHandle )
```

ADC1 GPIO Configuration PA1 ----> ADC1\_IN1 PA2 ----> ADC1\_IN2 PA3 ----> ADC1\_IN3 PA4 ----> ADC1\_IN4

ADC2 GPIO Configuration PA5 ----> ADC2\_IN5 PA6 ----> ADC2\_IN6

Definition at line 236 of file adc.c.

### 7.29.2.2 HAL\_ADC\_MspInit()

```
void HAL_ADC_MspInit (
    ADC_HandleTypeDef * adcHandle )
```

ADC1 GPIO Configuration PA1 ----> ADC1\_IN1 PA2 ----> ADC1\_IN2 PA3 ----> ADC1\_IN3 PA4 ----> ADC1\_IN4

ADC2 GPIO Configuration PA5 ----> ADC2\_IN5 PA6 ----> ADC2\_IN6

Definition at line 165 of file adc.c.

References Error\_Handler(), and hdma\_adc1.

### 7.29.2.3 MX\_ADC1\_Init()

```
void MX_ADC1_Init (
    void )
```

Configure the global features of the ADC (Clock, Resolution, Data Alignment and number of conversion)

Configure the analog watchdog

Configure for the selected ADC regular channel its corresponding rank in the sequencer and its sample time.

Configure for the selected ADC regular channel its corresponding rank in the sequencer and its sample time.

Configure for the selected ADC regular channel its corresponding rank in the sequencer and its sample time.

Configure for the selected ADC regular channel its corresponding rank in the sequencer and its sample time.

Definition at line 32 of file adc.c.

References Error\_Handler(), and hadc1.

Referenced by main().

### 7.29.2.4 MX\_ADC2\_Init()

```
void MX_ADC2_Init (
    void )
```

Configure the global features of the ADC (Clock, Resolution, Data Alignment and number of conversion)

Configure for the selected ADC regular channel its corresponding rank in the sequencer and its sample time.

Definition at line 118 of file adc.c.

References Error\_Handler(), and hadc2.

Referenced by main().

### 7.31.2 Macro Definition Documentation

### 7.31.2.1 HAL\_CAN\_ERROR\_INVALID\_CALLBACK

```
#define HAL_CAN_ERROR_INVALID_CALLBACK (0x00400000U)
```

Definition at line 46 of file can.c.

### 7.31.2.2 table\_size

```
#define table_size 128
```

Definition at line 52 of file can.c.

## 7.31.3 Typedef Documentation

### 7.31.3.1 CAN\_Callback

```
typedef struct CAN_Callback CAN_Callback
```

## 7.31.4 Function Documentation

### 7.31.4.1 \_\_uvCANtxCritSection()

```
uv_status __uvCANtxCritSection (
    uv_CAN_msg * tx_msg )
```

Definition at line 476 of file can.c.

References `uv_CAN_msg::data`, `uv_CAN_msg::dlc`, `uv_CAN_msg::flags`, `hcan2`, `uv_CAN_msg::msg_id`, `TxHeader`, `TxMailbox`, `UV_CAN_EXTENDED_ID`, `UV_ERROR`, and `UV_OK`.

Referenced by `uvSendCanMSG()`.

#### 7.31.4.2 callFunctionFromCANid()

```
static uv_status callFunctionFromCANid (
    uv_CAN_msg * msg ) [inline], [static]
```

Function to take CAN id and find its corresponding function Given a CAN id, find it in the hash table and call the function if it exists If it doesn't exist, return 1 If it does exist but there are multiple can ids with the same hash follow the next pointer until the right CAN id is found Then call the function

Definition at line 368 of file can.c.

References CAN\_callback\_table, CAN\_Callback::CAN\_id, CAN\_Callback::function, generateHash(), uv\_CAN\_↔msg::msg\_id, CAN\_Callback::next, UV\_ERROR, UV\_OK, and UV\_WARNING.

Referenced by CANbusRxSvcDaemon().

#### 7.31.4.3 CANbusRxSvcDaemon()

```
void CANbusRxSvcDaemon (
    void * args )
```

Background task that executes the CAN message callback functions.

Basically just snoops through the hash table

Definition at line 618 of file can.c.

References callback\_table\_mutex, callFunctionFromCANid(), uv\_task\_info::cmd\_data, killSelf(), Rx\_msg\_queue, suspendSelf(), uv\_task\_info::task\_handle, UV\_KILL\_CMD, UV\_OK, and UV\_SUSPEND\_CMD.

Referenced by uvSVCTaskManager().

#### 7.31.4.4 CANbusTxSvcDaemon()

```
void CANbusTxSvcDaemon (
    void * args )
```

Background task that handles any CAN messages that are being sent.

This task sits idle, until the time is right (it receives a notification from the uvSendCanMSG function) Once this condition has been met, it will actually call the HAL\_CAN\_AddTxMessage function. This is a very high priority task, meaning that it will pause whatever other code is going in order to run

Definition at line 551 of file can.c.

References uv\_task\_info::cmd\_data, uv\_CAN\_msg::data, uv\_CAN\_msg::dlc, uv\_CAN\_msg::flags, hcan2, killSelf(), uv\_CAN\_msg::msg\_id, suspendSelf(), Tx\_msg\_queue, TxHeader, TxMailbox, UV\_CAN\_EXTENDED\_ID, UV\_KI↔LL\_CMD, and UV\_SUSPEND\_CMD.

Referenced by uvSVCTaskManager().

#### 7.31.4.5 generateHash()

```
unsigned int generateHash (
    uint32_t Incoming_CAN_id )
```

HASH FUNCTION Take a can id and return a "random" hash id The hash id is in range from 0 to table\_size The hash id is similar to an array index in its implementation

Definition at line 351 of file can.c.

References table\_size.

Referenced by callFunctionFromCANid(), and insertCANMessageHandler().

#### 7.31.4.6 HAL\_CAN\_MspDeInit()

```
void HAL_CAN_MspDeInit (
    CAN_HandleTypeDef * canHandle )
```

CAN2 GPIO Configuration PB12 ----> CAN2\_RX PB13 ----> CAN2\_TX

Definition at line 266 of file can.c.

#### 7.31.4.7 HAL\_CAN\_MspInit()

```
void HAL_CAN_MspInit (
    CAN_HandleTypeDef * canHandle )
```

CAN2 GPIO Configuration PB12 ----> CAN2\_RX PB13 ----> CAN2\_TX

Definition at line 228 of file can.c.

#### 7.31.4.8 HAL\_CAN\_RxFifo0MsgPendingCallback()

```
void HAL_CAN_RxFifo0MsgPendingCallback (
    CAN_HandleTypeDef * hcan2 )
```

Definition at line 298 of file can.c.

References uv\_CAN\_msg::data, uv\_CAN\_msg::dlc, Error\_Handler(), hcan2, uv\_CAN\_msg::msg\_id, Rx\_msg\_↔ queue, and RxHeader.

#### 7.31.4.9 HAL\_CAN\_RxFifo1MsgPendingCallback()

```
void HAL_CAN_RxFifo1MsgPendingCallback (
    CAN_HandleTypeDef * hcan2 )
```

Definition at line 338 of file can.c.

#### 7.31.4.10 handleCANbusError()

```
void handleCANbusError (
    const CAN_HandleTypeDef * hcan,
    const uint32_t err_to_ignore )
```

Definition at line 71 of file can.c.

References HAL\_CAN\_ERROR\_INVALID\_CALLBACK.

Referenced by main().

#### 7.31.4.11 MX\_CAN2\_Init()

```
void MX_CAN2_Init (
    void )
```

Definition at line 150 of file can.c.

References Error\_Handler(), hcan2, and TxHeader.

Referenced by main().

#### 7.31.4.12 nuke\_hash\_table()

```
void nuke_hash_table ( )
```

Function to free all malloced memory Index through the hash table and free all the malloced memory at each index

Definition at line 453 of file can.c.

References CAN\_callback\_table, CAN\_Callback::next, and table\_size.

### 7.31.5 Variable Documentation

### 7.31.5.1 callback\_table\_mutex

```
SemaphoreHandle_t callback_table_mutex = NULL
```

Definition at line 69 of file can.c.

Referenced by CANbusRxSvcDaemon(), and insertCANMessageHandler().

### 7.31.5.2 CAN\_callback\_table

```
CAN_Callback CAN_callback_table[table_size] = {0}
```

Hash Table To Store CAN Messages Creates a hash table of size table\_size and type CAN\_Message Initialize all CAN messages in the hash table

Definition at line 67 of file can.c.

Referenced by callFunctionFromCANid(), insertCANMessageHandler(), and nuke\_hash\_table().

### 7.31.5.3 hcan2

```
CAN_HandleTypeDef hcan2
```

Definition at line 147 of file can.c.

Referenced by \_\_uvCANtxCritSection(), CAN2\_RX0\_IRQHandler(), CAN2\_RX1\_IRQHandler(), CAN2\_TX\_IRQHandler(), CANbusTxSvcDaemon(), HAL\_CAN\_RxFifo0MsgPendingCallback(), IMD\_Request\_Status(), main(), MC\_Request\_Data(), MotorControllerSpinTest(), MX\_CAN2\_Init(), PDU\_disable\_brake\_light(), PDU\_disable\_coolant\_pump(), PDU\_disable\_cooling\_fans(), PDU\_disable\_motor\_controller(), PDU\_disable\_shutdown\_circuit(), PDU\_enable\_brake\_light(), PDU\_enable\_coolant\_pump(), PDU\_enable\_cooling\_fans(), PDU\_enable\_motor\_controller(), PDU\_enable\_shutdown\_circuit(), PDU\_speaker\_chirp(), Update\_Batt\_Temp(), Update\_RPM(), and Update\_State\_Of\_Charge().

### 7.31.5.4 Rx\_msg\_queue

```
QueueHandle_t Rx_msg_queue = NULL [static]
```

Definition at line 50 of file can.c.

Referenced by CANbusRxSvcDaemon(), and HAL\_CAN\_RxFifo0MsgPendingCallback().

### 7.31.5.5 Tx\_msg\_queue

```
QueueHandle_t Tx_msg_queue = NULL [static]
```

Definition at line 49 of file can.c.

Referenced by CANbusTxSvcDaemon(), and uvSendCanMSG().

## 7.32 Core/Src/constants.c File Reference

```
#include "main.h"
```

### Variables

- CAN\_RxHeaderTypeDef [RxHeader](#)
- uint8\_t [TxData](#) [8]
- uint32\_t [TxMailbox](#)
- uint8\_t [RxData](#) [8]

### 7.32.1 Variable Documentation

#### 7.32.1.1 RxData

```
uint8_t RxData[8]
```

Definition at line 9 of file constants.c.

Referenced by MC\_Startup(), and MotorControllerSpinTest().

#### 7.32.1.2 RxHeader

```
CAN_RxHeaderTypeDef RxHeader
```

Definition at line 5 of file constants.c.

Referenced by HAL\_CAN\_RxFifo0MsgPendingCallback().

### 7.32.1.3 TxData

```
uint8_t TxData[8]
```

Definition at line 7 of file constants.c.

Referenced by `IMD_Request_Status()`, `main()`, `PDU_disable_brake_light()`, `PDU_disable_coolant_pump()`, `PDU_disable_cooling_fans()`, `PDU_disable_motor_controller()`, `PDU_disable_shutdown_circuit()`, `PDU_enable_brake_light()`, `PDU_enable_coolant_pump()`, `PDU_enable_cooling_fans()`, `PDU_enable_motor_controller()`, `PDU_enable_shutdown_circuit()`, `PDU_speaker_chirp()`, `tempMonitorTask()`, `Update_Batt_Temp()`, `Update_RPM()`, and `Update_State_Of_Charge()`.

### 7.32.1.4 TxHeader

```
CAN_TxHeaderTypeDef TxHeader
```

Definition at line 4 of file constants.c.

Referenced by `__uvCANtxCritSection()`, `CANbusTxSvcDaemon()`, `IMD_Request_Status()`, `main()`, `MX_CAN2_Init()`, `PDU_disable_brake_light()`, `PDU_disable_coolant_pump()`, `PDU_disable_cooling_fans()`, `PDU_disable_motor_controller()`, `PDU_disable_shutdown_circuit()`, `PDU_enable_brake_light()`, `PDU_enable_coolant_pump()`, `PDU_enable_cooling_fans()`, `PDU_enable_motor_controller()`, `PDU_enable_shutdown_circuit()`, `PDU_speaker_chirp()`, `tempMonitorTask()`, `Update_Batt_Temp()`, `Update_RPM()`, and `Update_State_Of_Charge()`.

### 7.32.1.5 TxMailbox

```
uint32_t TxMailbox
```

Definition at line 8 of file constants.c.

Referenced by `__uvCANtxCritSection()`, `CANbusTxSvcDaemon()`, `IMD_Request_Status()`, `main()`, `MC_Request_Data()`, `MotorControllerSpinTest()`, `PDU_disable_brake_light()`, `PDU_disable_coolant_pump()`, `PDU_disable_cooling_fans()`, `PDU_disable_motor_controller()`, `PDU_disable_shutdown_circuit()`, `PDU_enable_brake_light()`, `PDU_enable_coolant_pump()`, `PDU_enable_cooling_fans()`, `PDU_enable_motor_controller()`, `PDU_enable_shutdown_circuit()`, `PDU_speaker_chirp()`, `Update_Batt_Temp()`, `Update_RPM()`, and `Update_State_Of_Charge()`.

## 7.33 Core/Src/daq.c File Reference

```
#include "uvfr_utils.h"
#include "daq.h"
```

### Macros

- `#define _SRC_UVFR_DAQ`

## Functions

- void [deleteParamList](#) ()
- void [deleteDaqSubTask](#) ()
- [uv\\_status](#) [startDaqSubTasks](#) ()
- [uv\\_status](#) [stopDaqSubTasks](#) ()
- [uv\\_status](#) [initDaqTask](#) (void \*args)  
*initializes the master DAQ task, all that fun stuff. This task probably manages a while plethora of smaller tasks*
- void [daqMasterTask](#) (void \*args)
- void [daqSubTask](#) (void \*args)

## Variables

- void \* [param\\_LUT](#) [126]

### 7.33.1 Macro Definition Documentation

#### 7.33.1.1 `_SRC_UVFR_DAQ`

```
#define _SRC_UVFR_DAQ
```

Definition at line 1 of file daq.c.

### 7.33.2 Function Documentation

#### 7.33.2.1 `daqMasterTask()`

```
void daqMasterTask (
    void * args )
```

These here lines set the delay. This task executes exactly at the period specified, regardless of how long the task execution actually takes

```
*/
TickType_t tick_period = pdMS_TO_TICKS(params->task_period); //Convert ms of period to the RTOS ticks
//TickType_t last_time = xTaskGetTickCount(); /**
```

Definition at line 62 of file daq.c.

References [changeVehicleState\(\)](#), [uv\\_task\\_info::cmd\\_data](#), [killSelf\(\)](#), [suspendSelf\(\)](#), [uv\\_task\\_info::task\\_period](#), [UV\\_DRIVING](#), [UV\\_ERROR\\_STATE](#), [UV\\_KILL\\_CMD](#), [UV\\_READY](#), [UV\\_SUSPEND\\_CMD](#), and [vehicle\\_state](#).

Referenced by [initDaqTask\(\)](#).

### 7.33.2.2 daqSubTask()

```
void daqSubTask (
    void * args )
```

Definition at line 103 of file daq.c.

### 7.33.2.3 deleteDaqSubTask()

```
void deleteDaqSubTask ( )
```

Definition at line 13 of file daq.c.

### 7.33.2.4 deleteParamList()

```
void deleteParamList ( )
```

Definition at line 9 of file daq.c.

### 7.33.2.5 initDaqTask()

```
uv_status initDaqTask (
    void * args )
```

initializes the master DAQ task, all that fun stuff. This task probably manages a while plethora of smaller tasks

This is a fairly standard function

Definition at line 30 of file daq.c.

References `_UV_DEFAULT_TASK_STACK_SIZE`, `uv_task_info::active_states`, `daqMasterTask()`, `uv_task_info::deletion_states`, `PROGRAMMING`, `uv_task_info::stack_size`, `uv_task_info::suspension_states`, `uv_task_info::task_args`, `uv_task_info::task_function`, `uv_task_info::task_name`, `uv_task_info::task_period`, `uv_task_info::task_priority`, `UV_DRIVING`, `UV_ERROR`, `UV_ERROR_STATE`, `UV_LAUNCH_CONTROL`, `UV_OK`, `UV_READY`, and `uvCreateTask()`.

Referenced by `uvInitStateEngine()`.

### 7.33.2.6 startDaqSubTasks()

```
uv_status startDaqSubTasks ( )
```

Definition at line 17 of file daq.c.

References `UV_ERROR`.

### 7.33.2.7 stopDaqSubTasks()

```
uv_status stopDaqSubTasks ( )
```

Definition at line 21 of file daq.c.

References `UV_ERROR`.

## 7.33.3 Variable Documentation

### 7.33.3.1 param\_LUT

```
void* param_LUT[126]
```

Definition at line 7 of file daq.c.

## 7.34 Core/Src/dash.c File Reference

```
#include "dash.h"  
#include "can.h"  
#include "main.h"
```

### Functions

- void [Update\\_RPM](#) (int16\_t value)
- void [Update\\_Batt\\_Temp](#) (uint8\_t value)
- void [Update\\_State\\_Of\\_Charge](#) (uint8\_t value)

### 7.34.1 Function Documentation

#### 7.34.1.1 Update\_Batt\_Temp()

```
void Update_Batt_Temp (  
    uint8_t value )
```

Definition at line 29 of file dash.c.

References `Dash_Battery_Temperature`, `Error_Handler()`, `hcan2`, `TxData`, `TxHeader`, and `TxMailbox`.

### 7.34.1.2 Update\_RPM()

```
void Update_RPM (
    int16_t value )
```

Definition at line 9 of file dash.c.

References Dash\_RPM, Error\_Handler(), hcan2, TxData, TxHeader, and TxMailbox.

Referenced by main().

### 7.34.1.3 Update\_State\_Of\_Charge()

```
void Update_State_Of_Charge (
    uint8_t value )
```

Definition at line 48 of file dash.c.

References Dash\_State\_of\_Charge, Error\_Handler(), hcan2, TxData, TxHeader, and TxMailbox.

## 7.35 Core/Src/dma.c File Reference

This file provides code for the configuration of all the requested memory to memory DMA transfers.

```
#include "dma.h"
```

### Functions

- void [MX\\_DMA\\_Init](#) (void)

### 7.35.1 Detailed Description

This file provides code for the configuration of all the requested memory to memory DMA transfers.

Attention

This software is licensed under terms that can be found in the LICENSE file in the root directory of this software component. If no LICENSE file comes with this software, it is provided AS-IS.

## 7.35.2 Function Documentation

### 7.35.2.1 MX\_DMA\_Init()

```
void MX_DMA_Init (
    void )
```

Enable DMA controller clock

Definition at line 39 of file dma.c.

Referenced by main().

## 7.36 Core/Src/driving\_loop.c File Reference

File containing the meat and potatoes driving loop thread, and all supporting functions.

```
#include "main.h"
#include "uvfr_utils.h"
#include "can.h"
#include "motor_controller.h"
#include "FreeRTOS.h"
#include "task.h"
#include "cmsis_os.h"
#include "driving_loop.h"
```

### Functions

- enum [uv\\_status\\_t](#) [initDrivingLoop](#) (void \*argument)
- void [StartDrivingLoop](#) (void \*argument)

*Function implementing the ledTask thread.*

### Variables

- uint16\_t [adc1\\_APPPS1](#)
- uint16\_t [adc1\\_APPPS2](#)
- uint16\_t [adc1\\_BPS1](#)
- uint16\_t [adc1\\_BPS2](#)

### 7.36.1 Detailed Description

File containing the meat and potatoes driving loop thread, and all supporting functions.

## 7.36.2 Function Documentation

### 7.36.2.1 initDrivingLoop()

```
enum uv_status_t initDrivingLoop (
    void * argument )
```

Definition at line 25 of file driving\_loop.c.

References uv\_task\_info::active\_states, uv\_task\_info::deletion\_states, PROGRAMMING, uv\_task\_info::stack\_size, StartDrivingLoop(), uv\_task\_info::suspension\_states, uv\_task\_info::task\_args, uv\_task\_info::task\_function, uv\_task\_info::task\_name, uv\_task\_info::task\_period, uv\_task\_info::task\_priority, UV\_DRIVING, UV\_ERROR, UV\_ERROR\_STATE, UV\_INIT, UV\_LAUNCH\_CONTROL, UV\_OK, UV\_READY, UV\_SUSPENDED, and uvCreateTask().

Referenced by uvInitStateEngine().

### 7.36.2.2 StartDrivingLoop()

```
void StartDrivingLoop (
    void * argument )
```

Function implementing the ledTask thread.

Parameters

<i>argument</i>	Not used for now. Will have configuration settings later.
-----------------	---

Return values

<i>None</i>	This function is made to be the meat and potatoes of the entire vehicle.
-------------	--

The first thing we do here is create some local variables here, to cache whatever variables need cached. We will be caching variables that are used very frequently in every single loop iteration, and are not

This line extracts the specific driving loop parameters as specified in the vehicle settings

```
*/
driving_loop_args* dl_params = (driving_loop_args*) params->task_args;
/**
```

These here lines set the delay. This task executes exactly at the period specified, regardless of how long the task execution actually takes

```
*/
TickType_t tick_period = pdMS_TO_TICKS(params->task_period); //Convert ms of period to the RTOS ticks
TickType_t last_time = xTaskGetTickCount();
/**
```

Brake Plausibility Check

The way that this works is that if the brake pressure is greater than some threshold, and the accelerator pedal position is also greater than some threshold, the thing will register that a brake implausibility has occurred. This is not very cash money.

If this happens, we want to set the torque/speed output to zero. This will only reset itself once the brakes are set to less than a certain threshold. Honestly evil.

Definition at line 68 of file driving\_loop.c.

References `adc1_APPS1`, `adc1_APPS2`, `adc1_BPS1`, `adc1_BPS2`, `driving_loop_args::apps_plausibility_check↵_threshold`, `driving_loop_args::bps_plausibility_check_threshold`, `uv_task_info::cmd_data`, `Implausible`, `killSelf()`, `driving_loop_args::max_apps_offset`, `driving_loop_args::max_apps_value`, `driving_loop_args::max_BPS_value`, `Plausible`, `suspendSelf()`, `uv_task_info::task_args`, `uv_task_info::task_period`, `UV_KILL_CMD`, and `UV_SUSPEN↵D_CMD`.

Referenced by `initDrivingLoop()`.

### 7.36.3 Variable Documentation

#### 7.36.3.1 `adc1_APPS1`

```
uint16_t adc1_APPS1
```

Definition at line 64 of file main.c.

Referenced by `HAL_ADC_ConvCpltCallback()`, `HAL_ADC_LevelOutOfWindowCallback()`, `main()`, and `Start↵DrivingLoop()`.

#### 7.36.3.2 `adc1_APPS2`

```
uint16_t adc1_APPS2
```

Definition at line 65 of file main.c.

Referenced by `HAL_ADC_ConvCpltCallback()`, `HAL_ADC_LevelOutOfWindowCallback()`, `main()`, and `Start↵DrivingLoop()`.

#### 7.36.3.3 `adc1_BPS1`

```
uint16_t adc1_BPS1
```

Definition at line 66 of file main.c.

Referenced by `HAL_ADC_ConvCpltCallback()`, and `StartDrivingLoop()`.

### 7.36.3.4 adc1\_BPS2

```
uint16_t adc1_BPS2
```

Definition at line 67 of file main.c.

Referenced by HAL\_ADC\_ConvCpltCallback(), and StartDrivingLoop().

## 7.37 Core/Src/freertos.c File Reference

```
#include "FreeRTOS.h"
#include "task.h"
#include "main.h"
#include "cmsis_os.h"
#include "uvfr_utils.h"
```

### Functions

- void [StartDefaultTask](#) (void const \*argument)  
*Function implementing the defaultTask thread.*
- void [MX\\_FREERTOS\\_Init](#) (void)  
*FreeRTOS initialization.*

### 7.37.1 Function Documentation

#### 7.37.1.1 MX\_FREERTOS\_Init()

```
void MX_FREERTOS_Init (
    void )
```

FreeRTOS initialization.

## Parameters

<i>None</i>	
-------------	--

## Return values

<i>None</i>	
-------------	--

## Attention

DONT YOU FUCKING DARE DELETE THESE GOTO STATEMENTS, THEY ARE CRITICAL TO STOP THE OS FROM HANGING ITSELF

Definition at line 160 of file freertos.c.

References `defaultTaskHandle`, `init_settings`, `init_task_handle`, `StartDefaultTask()`, `uv_init_struct::use_default_↔` settings, and `uvInit()`.

Referenced by `main()`.

### 7.37.1.2 StartDefaultTask()

```
void StartDefaultTask (
    void const * argument )
```

Function implementing the defaultTask thread.

## Attention

DO NOT EVER CALL THIS. IT EXISTS TO STOP A COMPILER ERROR IN THE MX\_FREERTOS\_INIT FUNCTION

Definition at line 209 of file freertos.c.

Referenced by `MX_FREERTOS_Init()`.

### 7.37.1.3 vApplicationGetIdleTaskMemory()

```
void vApplicationGetIdleTaskMemory (
    StaticTask_t ** ppxIdleTaskTCBBuffer,
    StackType_t ** ppxIdleTaskStackBuffer,
    uint32_t * pulIdleTaskStackSize )
```

Definition at line 132 of file freertos.c.

References `configMINIMAL_STACK_SIZE`, `xIdleStack`, and `xIdleTaskTCBBuffer`.

#### 7.37.1.4 vApplicationGetTimerTaskMemory()

```
void vApplicationGetTimerTaskMemory (
    StaticTask_t ** ppxTimerTaskTCBBuffer,
    StackType_t ** ppxTimerTaskStackBuffer,
    uint32_t * pulTimerTaskStackSize )
```

Definition at line 146 of file freertos.c.

References configTIMER\_TASK\_STACK\_DEPTH, xTimerStack, and xTimerTaskTCBBuffer.

#### 7.37.1.5 vApplicationIdleHook()

```
void vApplicationIdleHook (
    void )
```

Definition at line 101 of file freertos.c.

#### 7.37.1.6 vApplicationMallocFailedHook()

```
__weak void vApplicationMallocFailedHook (
    void )
```

Definition at line 108 of file freertos.c.

#### 7.37.1.7 vApplicationStackOverflowHook()

```
__weak void vApplicationStackOverflowHook (
    TaskHandle_t xTask,
    signed char * pcTaskName )
```

Definition at line 89 of file freertos.c.

#### 7.37.1.8 vApplicationTickHook()

```
__weak void vApplicationTickHook (
    void )
```

Definition at line 76 of file freertos.c.

## 7.37.2 Variable Documentation

### 7.37.2.1 defaultTaskHandle

### 7.37.2.5 xIdleTaskTCBBuffer

```
StaticTask_t xIdleTaskTCBBuffer [static]
```

Definition at line 129 of file freertos.c.

Referenced by vApplicationGetIdleTaskMemory().

### 7.37.2.6 xTimerStack

```
StackType_t xTimerStack[configTIMER_TASK_STACK_DEPTH] [static]
```

Definition at line 144 of file freertos.c.

Referenced by vApplicationGetTimerTaskMemory().

### 7.37.2.7 xTimerTaskTCBBuffer

```
StaticTask_t xTimerTaskTCBBuffer [static]
```

Definition at line 143 of file freertos.c.

Referenced by vApplicationGetTimerTaskMemory().

## 7.38 Core/Src/gpio.c File Reference

This file provides code for the configuration of all used GPIO pins.

```
#include "gpio.h"
```

### Functions

- void [MX\\_GPIO\\_Init](#) (void)

### 7.38.1 Detailed Description

This file provides code for the configuration of all used GPIO pins.

## 7.39.1 Function Documentation

### 7.39.1.1 IMD\_Check\_Battery\_Voltage()

```
void IMD_Check_Battery_Voltage (
    uint8_t Data[] )
```

Definition at line 351 of file imd.c.

Referenced by `IMD_Parse_Message()`.

### 7.39.1.2 IMD\_Check\_Error\_Flags()

```
void IMD_Check_Error_Flags (
    uint8_t Data[] )
```

Definition at line 257 of file imd.c.

References `Err_CH`, `Err_clock`, `Err_temp`, `Err_Vexi`, `Err_Vpwr`, `Err_Vx1`, `Err_Vx2`, `Err_VxR`, and `Err_Watchdog`.

Referenced by `IMD_Parse_Message()`.

#### 7.39.1.3 IMD\_Check\_Isolation\_Capacitances()

```
void IMD_Check_Isolation_Capacitances (
    uint8_t Data[] )
```

Definition at line 337 of file imd.c.

Referenced by IMD\_Parse\_Message().

#### 7.39.1.4 IMD\_Check\_Isolation\_Resistances()

```
void IMD_Check_Isolation_Resistances (
    uint8_t Data[] )
```

Definition at line 312 of file imd.c.

References IMD\_High\_Uncertainty.

Referenced by IMD\_Parse\_Message().

#### 7.39.1.5 IMD\_Check\_Isolation\_State()

```
void IMD_Check_Isolation_State (
    uint8_t Data[] )
```

Definition at line 296 of file imd.c.

References IMD\_High\_Uncertainty.

Referenced by IMD\_Parse\_Message().

#### 7.39.1.6 IMD\_Check\_Max\_Battery\_Working\_Voltage()

```
void IMD_Check_Max_Battery_Working_Voltage (
    uint8_t Data[] )
```

Definition at line 388 of file imd.c.

Referenced by IMD\_Parse\_Message().

#### 7.39.1.7 IMD\_Check\_Part\_Name()

```
void IMD_Check_Part_Name (
    uint8_t Data[] )
```

Definition at line 401 of file imd.c.

References `IMD_Expected_Part_Name`, `IMD_Part_Name_0_Set`, `IMD_Part_Name_1_Set`, `IMD_Part_Name_2_Set`, `IMD_Part_Name_3_Set`, `IMD_Part_Name_Set`, `IMD_Read_Part_Name`, `Part_name_0`, `Part_name_1`, `Part_name_2`, and `Part_name_3`.

Referenced by `IMD_Parse_Message()`.

#### 7.39.1.8 IMD\_Check\_Safety\_Touch\_Current()

```
void IMD_Check_Safety_Touch_Current (
    uint8_t Data[] )
```

Definition at line 376 of file imd.c.

Referenced by `IMD_Parse_Message()`.

#### 7.39.1.9 IMD\_Check\_Safety\_Touch\_Energy()

```
void IMD_Check_Safety_Touch_Energy (
    uint8_t Data[] )
```

Definition at line 369 of file imd.c.

Referenced by `IMD_Parse_Message()`.

#### 7.39.1.10 IMD\_Check\_Serial\_Number()

```
void IMD_Check_Serial_Number (
    uint8_t Data[] )
```

Definition at line 483 of file imd.c.

References `IMD_Expected_Serial_Number`, `IMD_Read_Serial_Number`, `IMD_Serial_Number_0_Set`, `IMD_Serial_Number_1_Set`, `IMD_Serial_Number_2_Set`, `IMD_Serial_Number_3_Set`, `IMD_Serial_Number_Set`, `Serial_number_0`, `Serial_number_1`, `Serial_number_2`, and `Serial_number_3`.

### 7.40.2 Macro Definition Documentation

#### 7.40.2.1 DEBUG\_CAN\_IN\_MAIN

```
#define DEBUG_CAN_IN_MAIN 0
```

Definition at line 51 of file main.c.

### 7.40.3 Function Documentation

#### 7.40.3.1 Error\_Handler()

```
void Error_Handler (  
    void )
```

This function is executed in case of error occurrence.

Return values

<i>None</i>	
-------------	--

Definition at line 378 of file main.c.

Referenced by HAL\_ADC\_MspInit(), HAL\_CAN\_RxFifo0MsgPendingCallback(), IMD\_Parse\_Message(), IMD\_Request\_Status(), MX\_ADC1\_Init(), MX\_ADC2\_Init(), MX\_CAN2\_Init(), MX\_SPI1\_Init(), MX\_TIM3\_Init(), PDU\_disable\_brake\_light(), PDU\_disable\_coolant\_pump(), PDU\_disable\_cooling\_fans(), PDU\_disable\_motor\_controller(), PDU\_disable\_shutdown\_circuit(), PDU\_enable\_brake\_light(), PDU\_enable\_coolant\_pump(), PDU\_enable\_cooling\_fans(), PDU\_enable\_motor\_controller(), PDU\_enable\_shutdown\_circuit(), PDU\_speaker\_chirp(), SystemClock\_Config(), Update\_Batt\_Temp(), Update\_RPM(), and Update\_State\_Of\_Charge().

#### 7.40.3.2 HAL\_ADC\_ConvCpltCallback()

```
void HAL_ADC_ConvCpltCallback (
    ADC_HandleTypeDef * hadc )
```

Definition at line 275 of file main.c.

References adc1\_APPS1, adc1\_APPS2, adc1\_BPS1, adc1\_BPS2, ADC1\_SAMPLES, adc2\_CoolantFlow, adc2\_CoolantTemp, adc\_buf1, and adc\_buf2.

#### 7.40.3.3 HAL\_ADC\_LevelOutOfWindowCallback()

```
void HAL_ADC_LevelOutOfWindowCallback (
    ADC_HandleTypeDef * hadc )
```

Definition at line 330 of file main.c.

References adc1\_APPS1, adc1\_APPS2, hadc1, Red\_LED\_GPIO\_Port, and Red\_LED\_Pin.

#### 7.40.3.4 HAL\_GPIO\_EXTI\_Callback()

```
void HAL_GPIO_EXTI_Callback (
    uint16_t GPIO_Pin )
```

Definition at line 321 of file main.c.

#### 7.40.3.5 HAL\_TIM\_PeriodElapsedCallback()

```
void HAL_TIM_PeriodElapsedCallback (
    TIM_HandleTypeDef * htim )
```

Period elapsed callback in non blocking mode.

Note

This function is called when TIM1 interrupt took place, inside HAL\_TIM\_IRQHandler(). It makes a direct call to HAL\_IncTick() to increment a global variable "uwTick" used as application time base.

## Parameters

<i>htim</i>	: TIM handle
-------------	--------------

## Return values

<i>None</i>	
-------------	--

Definition at line 354 of file main.c.

References ADC2\_BUF\_LEN, adc\_buf2, hadc2, and htim3.

### 7.40.3.6 main()

```
int main (  
    void )
```

The application entry point.

## Return values

<i>int</i>	
------------	--

Definition at line 97 of file main.c.

References adc1\_APPS1, adc1\_APPS2, handleCANbusError(), hcan2, MX\_ADC1\_Init(), MX\_ADC2\_Init(), MX\_CAN2\_Init(), MX\_DMA\_Init(), MX\_FREERTOS\_Init(), MX\_GPIO\_Init(), MX\_SPI1\_Init(), MX\_TIM3\_Init(), SystemClock\_Config(), TxData, TxHeader, TxMailbox, and Update\_RPM().

### 7.40.3.7 MX\_FREERTOS\_Init()

```
void MX_FREERTOS_Init (  
    void )
```

FreeRTOS initialization.

## Parameters

<i>None</i>	
-------------	--

## Return values

<i>None</i>	
-------------	--

## Attention

DONT YOU FUCKING DARE DELETE THESE GOTO STATEMENTS, THEY ARE CRITICAL TO STOP THE OS FROM HANGING ITSELF

Definition at line 160 of file freertos.c.

References defaultTaskHandle, init\_settings, init\_task\_handle, StartDefaultTask(), uv\_init\_struct::use\_default\_↵ settings, and uvInit().

Referenced by main().

### 7.40.3.8 SystemClock\_Config()

```
void SystemClock_Config (
    void )
```

System Clock Configuration.

Return values

None	
------	--

Configure the main internal regulator output voltage

Initializes the RCC Oscillators according to the specified parameters in the RCC\_OscInitTypeDef structure.

Initializes the CPU, AHB and APB buses clocks

Definition at line 217 of file main.c.

References Error\_Handler().

Referenced by main().

## 7.40.4 Variable Documentation

### 7.40.4.1 adc1\_APPPS1

```
uint16_t adc1_APPPS1
```

Definition at line 64 of file main.c.

Referenced by HAL\_ADC\_ConvCpltCallback(), HAL\_ADC\_LevelOutOfWindowCallback(), main(), and Start↵ DrivingLoop().

#### 7.40.4.2 adc1\_APPS2

```
uint16_t adc1_APPS2
```

Definition at line 65 of file main.c.

Referenced by HAL\_ADC\_ConvCpltCallback(), HAL\_ADC\_LevelOutOfWindowCallback(), main(), and StartDrivingLoop().

#### 7.40.4.3 adc1\_BPS1

```
uint16_t adc1_BPS1
```

Definition at line 66 of file main.c.

Referenced by HAL\_ADC\_ConvCpltCallback(), and StartDrivingLoop().

#### 7.40.4.4 adc1\_BPS2

```
uint16_t adc1_BPS2
```

Definition at line 67 of file main.c.

Referenced by HAL\_ADC\_ConvCpltCallback(), and StartDrivingLoop().

#### 7.40.4.5 adc2\_CoolantFlow

```
uint16_t adc2_CoolantFlow
```

Definition at line 71 of file main.c.

Referenced by HAL\_ADC\_ConvCpltCallback().

#### 7.40.4.6 adc2\_CoolantTemp

```
uint16_t adc2_CoolantTemp
```

Definition at line 70 of file main.c.

Referenced by HAL\_ADC\_ConvCpltCallback().

#### 7.40.4.7 `adc_buf1`

```
volatile uint32_t adc_buf1[ADC1_BUF_LEN]
```

Definition at line 62 of file main.c.

Referenced by `HAL_ADC_ConvCpltCallback()`.

#### 7.40.4.8 `adc_buf2`

```
volatile uint32_t adc_buf2[ADC2_BUF_LEN]
```

Definition at line 69 of file main.c.

Referenced by `HAL_ADC_ConvCpltCallback()`, and `HAL_TIM_PeriodElapsedCallback()`.

## 7.41.1 Function Documentation

### 7.41.1.1 MC\_Check\_Error\_Warning()

```
void MC_Check_Error_Warning (
    uint8_t Data[] )
```

Definition at line 591 of file motor\_controller.c.

References AC\_current\_offset\_fault, ADC\_measurement\_problem, ADC\_sequencer\_problem, auxiliary\_voltage\_min\_limit, bleed\_resistor\_overload, bleeder\_resistor\_warning, CAN\_timeout\_error, check\_ecode\_ID, critical\_A\_C\_current, ecode\_timeout\_error, eeprom\_read\_error, feedback\_signal\_error, feedback\_signal\_problem, hardware\_fault, IGBT\_temp\_max\_limit, IGBT\_temperature\_warning, internal\_hardware\_voltage\_problem, mains\_voltage\_max\_limit, mains\_voltage\_min\_limit, motor\_temp\_max\_limit, motor\_temperature\_warning, parameter\_conflict\_detected, race\_away\_detected, rotate\_field\_enable\_not\_present\_norun, rotate\_field\_enable\_not\_present\_run, special\_CPU\_fault, speed\_actual\_resolution\_limit, tripzone\_glitch\_detected, Vout\_saturation\_max\_limit, warning\_5, warning\_9, and watchdog\_reset.

### 7.41.1.2 MC\_Check\_Firmware()

```
void MC_Check_Firmware (
    uint8_t Data[] )
```

Definition at line 725 of file motor\_controller.c.

### 7.41.1.3 MC\_Check\_Serial\_Number()

```
void MC_Check_Serial_Number (
    uint8_t Data[] )
```

Definition at line 721 of file motor\_controller.c.

### 7.41.1.4 MC\_Request\_Data()

```
void MC_Request_Data (
    uint8_t RegID )
```

Sends a CAN request to the motor controller to retrieve a specific register value. Constructs a CAN message with the specified register ID and sends it via the CAN queue.

## Parameters

<i>RegID</i>	The ID of the register to request data from.
--------------	--

Definition at line 230 of file motor\_controller.c.

References motor\_controllor\_settings::can\_id\_tx, hcan2, mc\_default\_settings, and TxMailbox.

Referenced by MC\_Startup(), and MotorControllerSpinTest().

### 7.41.1.5 MC\_Startup()

```
void MC_Startup (
    void * args )
```

Initializes the motor controller by performing the following steps:

1. Verifies the serial number from the motor controller.
2. Checks the firmware version to ensure compatibility.
3. Executes a motor spin test at low RPM to validate functionality.
4. Checks for errors and warnings from the motor controller.
5. Logs successful initialization if all checks pass.

Definition at line 739 of file motor\_controller.c.

References firmware\_version, FIRMWARE\_VERSION\_REGISTER, uv\_init\_task\_args::init\_info\_queue, MC\_Expected\_FW\_Version, MC\_Expected\_Serial\_Number, MC\_Request\_Data(), uv\_init\_task\_args::meta\_task\_handle, MOTOR\_CONTROLLER, motor\_controller\_errors\_warnings, MotorControllerErrorHandler(), MotorControllerSpinTest(), Parse\_Bamocar\_Response(), RxData, SERIAL\_NUMBER\_REGISTER, uv\_init\_task\_args::specific\_args, UV\_OK, and WaitFor\_CAN\_Response().

Referenced by uvInit().

### 7.41.1.6 MC\_Validate()

```
void MC_Validate ( )
```

Definition at line 717 of file motor\_controller.c.

### 7.41.1.7 MotorControllerErrorHandler()

```
static void MotorControllerErrorHandler (
    uint8_t * data,
    uint8_t length ) [static]
```

Processes error and warning information from the motor controller.

1. Extracts error and warning flags from the CAN message payload.
2. Logs or triggers a panic if critical errors are detected.

## Parameters

<i>data</i>	Pointer to the CAN message payload.
<i>length</i>	Length of the data payload.

Definition at line 119 of file motor\_controller.c.

References AC\_current\_offset\_fault, ADC\_measurement\_problem, ADC\_sequencer\_problem, auxiliary\_voltage\_min\_limit, bleed\_resistor\_overload, bleeder\_resistor\_warning, CAN\_timeout\_error, check\_ecode\_ID, critical\_A\_C\_current, ecode\_timeout\_error, eprom\_read\_error, feedback\_signal\_error, feedback\_signal\_problem, hardware\_fault, IGBT\_temp\_max\_limit, IGBT\_temperature\_warning, internal\_hardware\_voltage\_problem, mains\_voltage\_max\_limit, mains\_voltage\_min\_limit, motor\_temp\_max\_limit, motor\_temperature\_warning, parameter\_conflict\_detected, race\_away\_detected, rotate\_field\_enable\_not\_present\_norun, rotate\_field\_enable\_not\_present\_run, special\_CPU\_fault, speed\_actual\_resolution\_limit, tripzone\_glitch\_detected, Vout\_saturation\_max\_limit, warning\_5, warning\_9, and watchdog\_reset.

Referenced by MC\_Startup().

#### 7.41.1.8 MotorControllerSpinTest()

```
static uint16_t MotorControllerSpinTest (
    void ) [static]
```

Commands the motor to spin at a low RPM and validates the motor's response:

1. Sends a spin command via CAN.
2. Waits for the motor to reach the desired speed.
3. Checks the actual speed from the motor controller.
4. Stops the motor after validation.

##### Returns

0 if the test is successful, 1 for timeout, or 2 for insufficient speed.

Definition at line 62 of file motor\_controller.c.

References motor\_controller\_settings::can\_id\_tx, hcan2, mc\_default\_settings, MC\_Request\_Data(), N\_actual, N\_set, RxData, TxMailbox, and WaitFor\_CAN\_Response().

Referenced by MC\_Startup().

#### 7.41.1.9 Parse\_Bamocar\_Response()

```
static uint32_t Parse_Bamocar_Response (
    uint8_t * data,
    uint8_t length ) [static]
```

Parses a 32-bit response value from a Bamocar CAN message. Combines the four bytes of the payload into a single 32-bit integer.

## Parameters

<i>data</i>	Pointer to the CAN message payload.
<i>length</i>	Length of the data payload (expected to be 4 bytes).

## Returns

Parsed 32-bit value.

Definition at line 107 of file motor\_controller.c.

Referenced by MC\_Startup().

#### 7.41.1.10 WaitFor\_CAN\_Response()

```
static bool WaitFor_CAN_Response (  
    void ) [static]
```

Waits for a CAN response from the motor controller. Uses an RTOS semaphore to synchronize and check if a response is received within the timeout period.

## Returns

True if a response is received, otherwise false.

Definition at line 257 of file motor\_controller.c.

Referenced by MC\_Startup(), and MotorControllerSpinTest().

### 7.41.2 Variable Documentation

#### 7.41.2.1 canRxQueue

```
QueueHandle_t canRxQueue
```

#### 7.41.2.2 canTxQueue

```
QueueHandle_t canTxQueue
```

### 7.41.2.3 max\_motor\_speed

```
const uint32_t max_motor_speed = 3277
```

Definition at line 21 of file motor\_controller.c.

### 7.41.2.4 mc\_default\_settings

```
motor_controller_settings mc_default_settings
```

#### Initial value:

```
= {  
    .can_id_tx = 0x200,

### 7.44.1 Function Documentation

#### 7.44.1.1 [initPDU\(\)](#)

```
void initPDU (
    void * args )
```

Definition at line 183 of file pdu.c.

References [uv\\_init\\_task\\_args::init\\_info\\_queue](#), [uv\\_init\\_task\\_args::meta\\_task\\_handle](#), [PDU](#), and [UV\\_OK](#).

Referenced by [uvInit\(\)](#).

#### 7.44.1.2 PDU\_disable\_brake\_light()

```
void PDU_disable_brake_light ( )
```

Definition at line 48 of file pdu.c.

References `disable_brake_light_msg`, `Error_Handler()`, `hcan2`, `PDU_CAN_ID_Tx`, `TxData`, `TxHeader`, and `TxMailbox`.

#### 7.44.1.3 PDU\_disable\_coolant\_pump()

```
void PDU_disable_coolant_pump ( )
```

Definition at line 170 of file pdu.c.

References `disable_coolant_pump_msg`, `Error_Handler()`, `hcan2`, `PDU_CAN_ID_Tx`, `TxData`, `TxHeader`, and `TxMailbox`.

#### 7.44.1.4 PDU\_disable\_cooling\_fans()

```
void PDU_disable_cooling_fans ( )
```

Definition at line 136 of file pdu.c.

References `disable_left_cooling_fan_msg`, `disable_right_cooling_fan_msg`, `Error_Handler()`, `hcan2`, `PDU_CAN_ID_Tx`, `TxData`, `TxHeader`, and `TxMailbox`.

#### 7.44.1.5 PDU\_disable\_motor\_controller()

```
void PDU_disable_motor_controller ( )
```

Definition at line 74 of file pdu.c.

References `disable_motor_controller_msg`, `Error_Handler()`, `hcan2`, `PDU_CAN_ID_Tx`, `TxData`, `TxHeader`, and `TxMailbox`.

#### 7.44.1.6 PDU\_disable\_shutdown\_circuit()

```
void PDU_disable_shutdown_circuit ( )
```

Definition at line 100 of file pdu.c.

References `disable_shutdown_circuit_msg`, `Error_Handler()`, `hcan2`, `PDU_CAN_ID_Tx`, `TxData`, `TxHeader`, and `TxMailbox`.

#### 7.44.1.7 PDU\_enable\_brake\_light()

```
void PDU_enable_brake_light ( )
```

Definition at line 34 of file pdu.c.

References `enable_brake_light_msg`, `Error_Handler()`, `hcan2`, `PDU_CAN_ID_Tx`, `TxData`, `TxHeader`, and `TxMailbox`.

#### 7.44.1.8 PDU\_enable\_coolant\_pump()

```
void PDU_enable_coolant_pump ( )
```

Definition at line 158 of file pdu.c.

References `enable_coolant_pump_msg`, `Error_Handler()`, `hcan2`, `PDU_CAN_ID_Tx`, `TxData`, `TxHeader`, and `TxMailbox`.

#### 7.44.1.9 PDU\_enable\_cooling\_fans()

```
void PDU_enable_cooling_fans ( )
```

Definition at line 115 of file pdu.c.

References `enable_left_cooling_fan_msg`, `enable_right_cooling_fan_msg`, `Error_Handler()`, `hcan2`, `PDU_CAN_ID_Tx`, `TxData`, `TxHeader`, and `TxMailbox`.

#### 7.44.1.10 PDU\_enable\_motor\_controller()

```
void PDU_enable_motor_controller ( )
```

Definition at line 62 of file pdu.c.

References `enable_motor_controller_msg`, `Error_Handler()`, `hcan2`, `PDU_CAN_ID_Tx`, `TxData`, `TxHeader`, and `TxMailbox`.

#### 7.44.1.11 PDU\_enable\_shutdown\_circuit()

```
void PDU_enable_shutdown_circuit ( )
```

Definition at line 87 of file pdu.c.

References `enable_shutdown_circuit_msg`, `Error_Handler()`, `hcan2`, `PDU_CAN_ID_Tx`, `TxData`, `TxHeader`, and `TxMailbox`.

#### 7.44.1.12 PDU\_speaker\_chirp()

```
void PDU_speaker_chirp ( )
```

Definition at line 11 of file pdu.c.

References `disable_speaker_msg`, `enable_speaker_msg`, `Error_Handler()`, `hcan2`, `PDU_CAN_ID_Tx`, `TxData`, `TxHeader`, and `TxMailbox`.

### 7.45.1 Function Documentation

### 7.45.1.1 checkBlackHeight()

```
int checkBlackHeight (
    rbtree * rbt,
    rbnode * node ) [static]
```

Definition at line 562 of file rb\_tree.c.

References BLACK, rbnode::color, rbnode::left, rbnode::parent, RB\_NIL, RED, and rbnode::right.

Referenced by rbCheckBlackHeight().

### 7.45.1.2 checkOrder()

```
int checkOrder (
    rbtree * rbt,
    rbnode * n,
    void * min,
    void * max ) [static]
```

Definition at line 533 of file rb\_tree.c.

References rbtree::compare, rbnode::data, rbnode::left, RB\_NIL, and rbnode::right.

Referenced by rbCheckOrder().

### 7.45.1.3 deleteRepair()

```
void deleteRepair (
    rbtree * rbt,
    rbnode * current ) [static]
```

Definition at line 434 of file rb\_tree.c.

References BLACK, rbnode::color, rbnode::left, rbnode::parent, RB\_FIRST, RED, rbnode::right, rotateLeft(), and rotateRight().

Referenced by rbDelete().

### 7.45.1.4 destroyAllNodes()

```
void destroyAllNodes (
    rbtree * rbt,
    rbnode * node ) [static]
```

Definition at line 629 of file rb\_tree.c.

References rbtree::count, rbnode::data, rbtree::destroy, rbnode::left, rbnode::parent, RB\_NIL, and rbnode::right.

Referenced by rbDestroy().

#### 7.45.1.5 insertRepair()

```
void insertRepair (
    rbtree * rbt,
    rbnode * current ) [static]
```

Definition at line 277 of file `rb_tree.c`.

References `BLACK`, `rbnode::color`, `rbnode::left`, `rbnode::parent`, `RED`, `rbnode::right`, `rotateLeft()`, and `rotateRight()`.

Referenced by `rbInsert()`.

#### 7.45.1.6 print()

```
void print (
    rbtree * rbt,
    rbnode * node,
    void(*) (void *) print_func,
    int depth,
    char * label ) [static]
```

Definition at line 597 of file `rb_tree.c`.

References `rbnode::color`, `rbnode::data`, `rbnode::left`, `RB_NIL`, `RED`, and `rbnode::right`.

Referenced by `rbPrint()`.

#### 7.45.1.7 rb\_apply()

```
int rb_apply (
    rbtree * rbt,
    rbnode * node,
    int(*) (void *, void *) func,
    void * cookie,
    enum rbtraversal order )
```

Definition at line 114 of file `rb_tree.c`.

References `rbnode::data`, `INORDER`, `rbnode::left`, `POSTORDER`, `PREORDER`, `RB_NIL`, and `rbnode::right`.

#### 7.45.1.8 rbCheckBlackHeight()

```
int rbCheckBlackHeight (
    rbtree * rbt )
```

Definition at line 551 of file `rb_tree.c`.

References `checkBlackHeight()`, `RB_FIRST`, `RB_NIL`, `RB_ROOT`, and `RED`.

Referenced by `rbPrint()`.

### 7.45.1.9 rbCheckOrder()

```
int rbCheckOrder (
    rbtree * rbt,
    void * min,
    void * max )
```

Definition at line 525 of file rb\_tree.c.

References `checkOrder()`, and `RB_FIRST`.

### 7.45.1.10 rbCreate()

```
rbtree* rbCreate (
    int(*) (const void *, const void *) compare_func,
    void(*) (void *) destroy_func )
```

Create and initialize a binary search tree.

Definition at line 26 of file rb\_tree.c.

References `BLACK`, `rbnode::color`, `rbtree::compare`, `rbtree::count`, `rbnode::data`, `rbtree::destroy`, `rbnode::left`, `rbtree::min`, `rbtree::nil`, `rbnode::parent`, `RB_NIL`, `rbnode::right`, and `rbtree::root`.

### 7.45.1.11 rbDelete()

```
void* rbDelete (
    rbtree * rbt,
    rbnode * node,
    int keep )
```

Definition at line 344 of file rb\_tree.c.

References `BLACK`, `rbnode::color`, `rbtree::count`, `rbnode::data`, `deleteRepair()`, `rbtree::destroy`, `rbnode::left`, `rbtree::min`, `rbnode::parent`, `RB_FIRST`, `RB_NIL`, `rbSuccessor()`, `RED`, and `rbnode::right`.

### 7.45.1.12 rbDestroy()

```
void rbDestroy (
    rbtree * rbt )
```

Destroy the tree, and de-allocate it's elements.

Definition at line 59 of file rb\_tree.c.

References `destroyAllNodes()`, and `RB_FIRST`.

#### 7.45.1.13 rbFind()

```
rbnode* rbFind (
    rbtree * rbt,
    void * data )
```

Find a node of the tree based off the data you provide the tree.

Definition at line 69 of file rb\_tree.c.

References `rbtree::compare`, `rbnode::data`, `rbnode::left`, `RB_FIRST`, `RB_NIL`, and `rbnode::right`.

#### 7.45.1.14 rbInsert()

```
rbnode* rbInsert (
    rbtree * rbt,
    void * data )
```

Definition at line 191 of file rb\_tree.c.

References `BLACK`, `rbnode::color`, `rbtree::compare`, `rbtree::count`, `rbnode::data`, `rbtree::destroy`, `insertRepair()`, `rbnode::left`, `rbtree::min`, `rbnode::parent`, `RB_FIRST`, `RB_MIN`, `RB_NIL`, `RB_ROOT`, `RED`, and `rbnode::right`.

#### 7.45.1.15 rbPrint()

```
void rbPrint (
    rbtree * rbt,
    void(*) (void *) print_func )
```

Definition at line 587 of file rb\_tree.c.

References `print()`, `RB_FIRST`, and `rbCheckBlackHeight()`.

#### 7.45.1.16 rbSuccessor()

```
rbnode* rbSuccessor (
    rbtree * rbt,
    rbnode * node )
```

Definition at line 90 of file rb\_tree.c.

References `rbnode::left`, `rbnode::parent`, `RB_NIL`, `RB_ROOT`, and `rbnode::right`.

Referenced by `rbDelete()`.

### 7.45.1.17 rotateLeft()

```
void rotateLeft (
    rbtree * rbt,
    rbnode * x ) [static]
```

Definition at line 137 of file rb\_tree.c.

References `rbnode::left`, `rbnode::parent`, `RB_NIL`, and `rbnode::right`.

Referenced by `deleteRepair()`, and `insertRepair()`.

### 7.45.1.18 rotateRight()

```
void rotateRight (
    rbtree * rbt,
    rbnode * x ) [static]
```

Definition at line 163 of file rb\_tree.c.

References `rbnode::left`, `rbnode::parent`, `RB_NIL`, and `rbnode::right`.

Referenced by `deleteRepair()`, and `insertRepair()`.

## 7.46 Core/Src/spi.c File Reference

This file provides code for the configuration of the SPI instances.

```
#include "spi.h"
```

### Functions

- void `MX_SPI1_Init` (void)
- void `HAL_SPI_MspInit` (SPI\_HandleTypeDef \*spiHandle)
- void `HAL_SPI_MspDeInit` (SPI\_HandleTypeDef \*spiHandle)

### Variables

- SPI\_HandleTypeDef `hspi1`

### 7.46.1 Detailed Description

This file provides code for the configuration of the SPI instances.

This software is licensed under terms that can be found in the LICENSE file in the root directory of this software component. If no LICENSE file comes with this software, it is provided AS-IS.

### 7.46.2 Function Documentation

#### 7.46.2.1 HAL\_SPI\_MspDeInit()

```
void HAL_SPI_MspDeInit (
    SPI_HandleTypeDef * spiHandle )
```

SPI1 GPIO Configuration PA7 ----> SPI1\_MOSI PB3 ----> SPI1\_SCK PB4 ----> SPI1\_MISO

Definition at line 101 of file spi.c.

#### 7.46.2.2 HAL\_SPI\_MspInit()

```
void HAL_SPI_MspInit (
    SPI_HandleTypeDef * spiHandle )
```

SPI1 GPIO Configuration PA7 ----> SPI1\_MOSI PB3 ----> SPI1\_SCK PB4 ----> SPI1\_MISO

Definition at line 62 of file spi.c.

#### 7.46.2.3 MX\_SPI1\_Init()

```
void MX_SPI1_Init (
    void )
```

Definition at line 30 of file spi.c.

References Error\_Handler(), and hspi1.

Referenced by main().

### 7.46.3 Variable Documentation

#### 7.46.3.1 hspi1

`SPI_HandleTypeDef hspi1`

Definition at line 27 of file spi.c.

Referenced by `MX_SPI1_Init()`.

## 7.47 Core/Src/stm32f4xx\_hal\_msp.c File Reference

This file provides code for the MSP Initialization and de-Initialization codes.

```
#include "main.h"
```

### Functions

- void [HAL\\_MspInit](#) (void)

#### 7.47.1 Detailed Description

This file provides code for the MSP Initialization and de-Initialization codes.

Attention

Copyright (c) 2023 STMicroelectronics. All rights reserved.

This software is licensed under terms that can be found in the LICENSE file in the root directory of this software component. If no LICENSE file comes with this software, it is provided AS-IS.

#### 7.47.2 Function Documentation

##### 7.47.2.1 HAL\_MspInit()

```
void HAL_MspInit (  
    void )
```

Initializes the Global MSP.

Definition at line 64 of file stm32f4xx\_hal\_msp.c.

## 7.48 Core/Src/stm32f4xx\_hal\_timebase\_tim.c File Reference

HAL time base based on the hardware TIM.

```
#include "stm32f4xx_hal.h"
#include "stm32f4xx_hal_tim.h"
```

### Functions

- HAL\_StatusTypeDef [HAL\\_InitTick](#) (uint32\_t TickPriority)  
*This function configures the TIM1 as a time base source. The time source is configured to have 1ms time base with a dedicated Tick interrupt priority.*
- void [HAL\\_SuspendTick](#) (void)  
*Suspend Tick increment.*
- void [HAL\\_ResumeTick](#) (void)  
*Resume Tick increment.*

### Variables

- TIM\_HandleTypeDef [htim1](#)

#### 7.48.1 Detailed Description

HAL time base based on the hardware TIM.

Attention

Copyright (c) 2024 STMicroelectronics. All rights reserved.

This software is licensed under terms that can be found in the LICENSE file in the root directory of this software component. If no LICENSE file comes with this software, it is provided AS-IS.

#### 7.48.2 Function Documentation

##### 7.48.2.1 HAL\_InitTick()

```
HAL_StatusTypeDef HAL_InitTick (
    uint32_t TickPriority )
```

This function configures the TIM1 as a time base source. The time source is configured to have 1ms time base with a dedicated Tick interrupt priority.

Note

This function is called automatically at the beginning of program after reset by HAL\_Init() or at any time when clock is configured, by HAL\_RCC\_ClockConfig().

## Parameters

<i>TickPriority</i>	Tick interrupt priority.
---------------------	--------------------------

## Return values

<i>HAL</i>	status
------------	--------

Definition at line 41 of file stm32f4xx\_hal\_timebase\_tim.c.

References htim1.

### 7.48.2.2 HAL\_ResumeTick()

```
void HAL_ResumeTick (
    void )
```

Resume Tick increment.

## Note

Enable the tick increment by Enabling TIM1 update interrupt.

## Parameters

<i>None</i>	
-------------	--

## Return values

<i>None</i>	
-------------	--

Definition at line 121 of file stm32f4xx\_hal\_timebase\_tim.c.

References htim1.

### 7.48.2.3 HAL\_SuspendTick()

```
void HAL_SuspendTick (
    void )
```

Suspend Tick increment.

## Note

Disable the tick increment by disabling TIM1 update interrupt.

Parameters

<i>None</i>	
-------------	--

Return values

<i>None</i>	
-------------	--

Definition at line 109 of file stm32f4xx\_hal\_timebase\_tim.c.

References htim1.

### 7.48.3 Variable Documentation

#### 7.48.3.1 htim1

TIM\_HandleTypeDef htim1

Definition at line 28 of file stm32f4xx\_hal\_timebase\_tim.c.

Referenced by HAL\_InitTick(), HAL\_ResumeTick(), HAL\_SuspendTick(), and TIM1\_UP\_TIM10\_IRQHandler().

## 7.49 Core/Src/stm32f4xx\_it.c File Reference

Interrupt Service Routines.

```
#include "main.h"
#include "stm32f4xx_it.h"
```

### Functions

- void [NMI\\_Handler](#) (void)  
*This function handles Non maskable interrupt.*
- void [HardFault\\_Handler](#) (void)  
*This function handles Hard fault interrupt.*
- void [MemManage\\_Handler](#) (void)  
*This function handles Memory management fault.*
- void [BusFault\\_Handler](#) (void)  
*This function handles Pre-fetch fault, memory access fault.*
- void [UsageFault\\_Handler](#) (void)  
*This function handles Undefined instruction or illegal state.*
- void [DebugMon\\_Handler](#) (void)  
*This function handles Debug monitor.*
- void [EXTI0\\_IRQHandler](#) (void)

*This function handles EXTI line0 interrupt.*

- void [TIM1\\_UP\\_TIM10\\_IRQHandler](#) (void)

*This function handles TIM1 update interrupt and TIM10 global interrupt.*

- void [DMA2\\_Stream0\\_IRQHandler](#) (void)

*This function handles DMA2 stream0 global interrupt.*

- void [CAN2\\_TX\\_IRQHandler](#) (void)

*This function handles CAN2 TX interrupts.*

- void [CAN2\\_RX0\\_IRQHandler](#) (void)

*This function handles CAN2 RX0 interrupts.*

- void [CAN2\\_RX1\\_IRQHandler](#) (void)

*This function handles CAN2 RX1 interrupt.*

## Variables

- DMA\_HandleTypeDef [hdma\\_adc1](#)
- CAN\_HandleTypeDef [hcan2](#)
- TIM\_HandleTypeDef [htim1](#)

### 7.49.1 Detailed Description

Interrupt Service Routines.

Attention

Copyright (c) 2023 STMicroelectronics. All rights reserved.

This software is licensed under terms that can be found in the LICENSE file in the root directory of this software component. If no LICENSE file comes with this software, it is provided AS-IS.

### 7.49.2 Function Documentation

#### 7.49.2.1 BusFault\_Handler()

```
void BusFault_Handler (  
    void )
```

This function handles Pre-fetch fault, memory access fault.

Definition at line 117 of file stm32f4xx\_it.c.

#### 7.49.2.2 CAN2\_RX0\_IRQHandler()

```
void CAN2_RX0_IRQHandler (  
    void )
```

This function handles CAN2 RX0 interrupts.

Definition at line 223 of file stm32f4xx\_it.c.

References hcan2.

#### 7.49.2.3 CAN2\_RX1\_IRQHandler()

```
void CAN2_RX1_IRQHandler (  
    void )
```

This function handles CAN2 RX1 interrupt.

Definition at line 237 of file stm32f4xx\_it.c.

References hcan2.

#### 7.49.2.4 CAN2\_TX\_IRQHandler()

```
void CAN2_TX_IRQHandler (  
    void )
```

This function handles CAN2 TX interrupts.

Definition at line 209 of file stm32f4xx\_it.c.

References hcan2.

#### 7.49.2.5 DebugMon\_Handler()

```
void DebugMon_Handler (  
    void )
```

This function handles Debug monitor.

Definition at line 147 of file stm32f4xx\_it.c.

#### 7.49.2.6 DMA2\_Stream0\_IRQHandler()

```
void DMA2_Stream0_IRQHandler (  
    void )
```

This function handles DMA2 stream0 global interrupt.

Definition at line 195 of file stm32f4xx\_it.c.

References `hdma_adc1`.

#### 7.49.2.7 EXTI0\_IRQHandler()

```
void EXTI0_IRQHandler (  
    void )
```

This function handles EXTI line0 interrupt.

Definition at line 167 of file stm32f4xx\_it.c.

References `Start_Button_Input_Pin`.

#### 7.49.2.8 HardFault\_Handler()

```
void HardFault_Handler (  
    void )
```

This function handles Hard fault interrupt.

Definition at line 87 of file stm32f4xx\_it.c.

#### 7.49.2.9 MemManage\_Handler()

```
void MemManage_Handler (  
    void )
```

This function handles Memory management fault.

Definition at line 102 of file stm32f4xx\_it.c.

#### 7.49.2.10 NMI\_Handler()

```
void NMI_Handler (
    void )
```

This function handles Non maskable interrupt.

Definition at line 72 of file stm32f4xx\_it.c.

#### 7.49.2.11 TIM1\_UP\_TIM10\_IRQHandler()

```
void TIM1_UP_TIM10_IRQHandler (
    void )
```

This function handles TIM1 update interrupt and TIM10 global interrupt.

Definition at line 181 of file stm32f4xx\_it.c.

References htim1.

#### 7.49.2.12 UsageFault\_Handler()

```
void UsageFault_Handler (
    void )
```

This function handles Undefined instruction or illegal state.

Definition at line 132 of file stm32f4xx\_it.c.

### 7.49.3 Variable Documentation

#### 7.49.3.1 hcan2

```
CAN_HandleTypeDef hcan2
```

Definition at line 147 of file can.c.

Referenced by \_\_uvCANtxCritSection(), CAN2\_RX0\_IRQHandler(), CAN2\_RX1\_IRQHandler(), CAN2\_TX\_IRQHandler(), CANbusTxSvcDaemon(), HAL\_CAN\_RxFifo0MsgPendingCallback(), and MX\_CAN2\_Init().

### 7.49.3.2 hdma\_adc1

DMA\_HandleTypeDef hdma\_adc1

Definition at line 29 of file adc.c.

Referenced by DMA2\_Stream0\_IRQHandler(), and HAL\_ADC\_MspInit().

### 7.49.3.3 htim1

TIM\_HandleTypeDef htim1

Definition at line 28 of file stm32f4xx\_hal\_timebase\_tim.c.

Referenced by HAL\_InitTick(), HAL\_ResumeTick(), HAL\_SuspendTick(), and TIM1\_UP\_TIM10\_IRQHandler().

## 7.50 Core/Src/syscalls.c File Reference

STM32CubeIDE Minimal System calls file.

```
#include <sys/stat.h>
#include <stdlib.h>
#include <errno.h>
#include <stdio.h>
#include <signal.h>
#include <time.h>
#include <sys/time.h>
#include <sys/times.h>
```

### Functions

- int [\\_\\_io\\_putchar](#) (int ch) [\\_\\_attribute\\_\\_\(\(weak\)\)](#)
- int [\\_\\_io\\_getchar](#) (void)
- void [initialise\\_monitor\\_handles](#) ()
- int [\\_getpid](#) (void)
- int [\\_kill](#) (int pid, int sig)
- void [\\_exit](#) (int status)
- [\\_\\_attribute\\_\\_\(\(weak\)\)](#)
- int [\\_close](#) (int file)

### 7.50.2 Function Documentation

#### 7.50.2.1 `__attribute__()`

```
__attribute__ (
                (weak) )
```

Definition at line 67 of file syscalls.c.

References `__io_getchar()`.

#### 7.50.2.2 `__io_getchar()`

```
int __io_getchar (
                void )
```

Definition at line 36 of file syscalls.c.

Referenced by `__attribute__()`.

### 7.50.2.3 `__io_putchar()`

```
int __io_putchar (  
    int ch )
```

### 7.50.2.4 `_close()`

```
int _close (  
    int file )
```

Definition at line 92 of file syscalls.c.

### 7.50.2.5 `_execve()`

```
int _execve (  
    char * name,  
    char ** argv,  
    char ** env )
```

Definition at line 169 of file syscalls.c.

### 7.50.2.6 `_exit()`

```
void _exit (  
    int status )
```

Definition at line 61 of file syscalls.c.

References `_kill()`.

### 7.50.2.7 `_fork()`

```
int _fork (  
    void )
```

Definition at line 163 of file syscalls.c.

#### 7.50.2.8 `_fstat()`

```
int _fstat (
    int file,
    struct stat * st )
```

Definition at line 99 of file syscalls.c.

#### 7.50.2.9 `_getpid()`

```
int _getpid (
    void )
```

Definition at line 48 of file syscalls.c.

#### 7.50.2.10 `_isatty()`

```
int _isatty (
    int file )
```

Definition at line 106 of file syscalls.c.

#### 7.50.2.11 `_kill()`

```
int _kill (
    int pid,
    int sig )
```

Definition at line 53 of file syscalls.c.

Referenced by `_exit()`.

#### 7.50.2.12 `_link()`

```
int _link (
    char * old,
    char * new )
```

Definition at line 155 of file syscalls.c.

**7.50.2.13 \_lseek()**

```
int _lseek (
    int file,
    int ptr,
    int dir )
```

Definition at line 112 of file syscalls.c.

**7.50.2.14 \_open()**

```
int _open (
    char * path,
    int flags,
    ... )
```

Definition at line 120 of file syscalls.c.

**7.50.2.15 \_stat()**

```
int _stat (
    char * file,
    struct stat * st )
```

Definition at line 148 of file syscalls.c.

**7.50.2.16 \_times()**

```
int _times (
    struct tms * buf )
```

Definition at line 142 of file syscalls.c.

**7.50.2.17 \_unlink()**

```
int _unlink (
    char * name )
```

Definition at line 135 of file syscalls.c.

#### 7.50.2.18 `_wait()`

```
int _wait (
    int * status )
```

Definition at line 128 of file syscalls.c.

#### 7.50.2.19 `initialise_monitor_handles()`

```
void initialise_monitor_handles ( )
```

Definition at line 44 of file syscalls.c.

### 7.50.3 Variable Documentation

#### 7.50.3.1 `environ`

```
char** environ = __env
```

Definition at line 40 of file syscalls.c.

## 7.51 Core/Src/systemem.c File Reference

STM32CubeIDE System Memory calls file.

```
#include <errno.h>
#include <stdint.h>
```

### Functions

- void \* [\\_sbrk](#) (ptrdiff\_t incr)  
*[\\_sbrk\(\)](#) allocates memory to the newlib heap and is used by malloc and others from the C library*

### Variables

- static uint8\_t \* [\\_\\_sbrk\\_heap\\_end](#) = NULL

### 7.51.1 Detailed Description

STM32CubeIDE System Memory calls file.

Author

Generated by STM32CubeIDE

For more information about which C functions  
need which of these lowlevel functions  
please consult the newlib libc manual

Attention

Copyright (c) 2023 STMicroelectronics. All rights reserved.

This software is licensed under terms that can be found in the LICENSE file in the root directory of this software component. If no LICENSE file comes with this software, it is provided AS-IS.

### 7.51.2 Function Documentation

#### 7.51.2.1 `_sbrk()`

```
void* _sbrk (
    ptrdiff_t incr )
```

`_sbrk()` allocates memory to the newlib heap and is used by malloc and others from the C library

```
* #####
* # .data # .bss #          newlib heap          #          MSP stack          #
* #          #          #          # Reserved by _Min_Stack_Size #
* #####
* ^-- RAM start          ^-- _end          _estack, RAM end --^
*
```

This implementation starts allocating at the '`_end`' linker symbol The '`_Min_Stack_Size`' linker symbol reserves a memory for the MSP stack The implementation considers '`_estack`' linker symbol to be RAM end NOTE: If the MSP stack, at any point during execution, grows larger than the reserved size, please increase the '`_Min_Stack_Size`'.

Parameters

<i>incr</i>	Memory size
-------------	-------------

Returns

Pointer to allocated memory

Definition at line 53 of file sysmem.c.

References `__sbrk_heap_end`.

### 7.51.3 Variable Documentation

#### 7.51.3.1 `__sbrk_heap_end`

```
uint8_t* __sbrk_heap_end = NULL [static]
```

Pointer to the current high watermark of the heap usage

Definition at line 30 of file sysmem.c.

Referenced by `_sbrk()`.

## 7.52 Core/Src/system\_stm32f4xx.c File Reference

CMSIS Cortex-M4 Device Peripheral Access Layer System Source File.

```
#include "stm32f4xx.h"
```

### Macros

- `#define HSE_VALUE ((uint32_t)25000000)`
- `#define HSI_VALUE ((uint32_t)16000000)`

### Functions

- void `SystemInit` (void)  
*Setup the microcontroller system Initialize the FPU setting, vector table location and External memory configuration.*
- void `SystemCoreClockUpdate` (void)  
*Update SystemCoreClock variable according to Clock Register Values. The SystemCoreClock variable contains the core clock (HCLK), it can be used by the user application to setup the SysTick timer or configure other parameters.*

### Variables

- uint32\_t `SystemCoreClock` = 16000000
- const uint8\_t `AHBPrescTable` [16] = {0, 0, 0, 0, 0, 0, 0, 0, 1, 2, 3, 4, 6, 7, 8, 9}
- const uint8\_t `APBPrescTable` [8] = {0, 0, 0, 0, 1, 2, 3, 4}

### 7.52.1 Detailed Description

CMSIS Cortex-M4 Device Peripheral Access Layer System Source File.

Author

MCD Application Team This file provides two functions and one global variable to be called from user application:

- [SystemInit\(\)](#): This function is called at startup just after reset and before branch to main program. This call is made inside the "startup\_stm32f4xx.s" file.
- SystemCoreClock variable: Contains the core clock (HCLK), it can be used by the user application to setup the SysTick timer or configure other parameters.
- [SystemCoreClockUpdate\(\)](#): Updates the variable SystemCoreClock and must be called whenever the core clock is changed during program execution.

## 7.53 Core/Src/temp\_monitoring.c File Reference

```
#include "uvfr_utils.h"
#include "gpio.h"
```

### Functions

- [uv\\_status initTempMonitor](#) (void \*arguments)
- void [testfunc](#) (uv\_CAN\_msg \*msg)
- void [testfunc2](#) (uv\_CAN\_msg \*msg)
- void [tempMonitorTask](#) (void \*args)

*Monitors the temperatures of various points in the tractive system, and activates various cooling systems and such accordingly.*

### 7.53.1 Function Documentation

### 7.53.1.1 initTempMonitor()

```
uv_status initTempMonitor (
    void * arguments )
```

Definition at line 12 of file temp\_monitoring.c.

References `_UV_DEFAULT_TASK_STACK_SIZE`, `uv_task_info::active_states`, `uv_task_info::deletion_states`, `PROGRAMMING`, `uv_task_info::stack_size`, `uv_task_info::suspension_states`, `uv_task_info::task_args`, `uv_task_info::task_function`, `uv_task_info::task_name`, `uv_task_info::task_period`, `uv_task_info::task_priority`, `tempMonitorTask()`, `UV_DRIVING`, `UV_ERROR`, `UV_ERROR_STATE`, `UV_LAUNCH_CONTROL`, `UV_OK`, `UV_READY`, and `uvCreateTask()`.

Referenced by `uvInitStateEngine()`.

### 7.53.1.2 tempMonitorTask()

```
void tempMonitorTask (
    void * args )
```

Monitors the temperatures of various points in the tractive system, and activates various cooling systems and such accordingly.

Atm, this is mostly serving as an example of a task These here lines set the delay. This task executes exactly at the period specified, regardless of how long the task execution actually takes

```
*/
TickType_t tick_period = pdMS_TO_TICKS(params->task_period); //Convert ms of period to the RTOS ticks
TickType_t last_time = 0;
/**
```

This is an example of a task control point, which is the spot in the task where the task decides what needs to be done, based on the commands it has received from the task manager and the SCD

Definition at line 70 of file temp\_monitoring.c.

References `uv_task_info::cmd_data`, `uv_CAN_msg::data`, `uv_CAN_msg::dlc`, `uv_CAN_msg::flags`, `insertCANMessageHandler()`, `killSelf()`, `uv_CAN_msg::msg_id`, `suspendSelf()`, `uv_task_info::task_period`, `testfunc()`, `testfunc2()`, `TxData`, `TxHeader`, `UV_KILL_CMD`, `UV_SUSPEND_CMD`, `uvSendCanMSG()`, and `uvTaskDelayUntil`.

Referenced by `initTempMonitor()`.

### 7.53.1.3 testfunc()

```
void testfunc (
    uv_CAN_msg * msg )
```

Definition at line 42 of file temp\_monitoring.c.

References `changeVehicleState()`, `UV_DRIVING`, `UV_ERROR_STATE`, `UV_READY`, and `vehicle_state`.

Referenced by `tempMonitorTask()`.

#### 7.53.1.4 testfunc2()

```
void testfunc2 (
    uv_CAN_msg * msg )
```

Definition at line 52 of file temp\_monitoring.c.

References `uv_CAN_msg::data`, `uv_CAN_msg::flags`, `uv_CAN_msg::msg_id`, and `uvSendCanMSG()`.

Referenced by `tempMonitorTask()`.

## 7.54 Core/Src/tim.c File Reference

This file provides code for the configuration of the TIM instances.

```
#include "tim.h"
```

### Functions

- void [MX\\_TIM3\\_Init](#) (void)
- void [HAL\\_TIM\\_Base\\_MspInit](#) (TIM\_HandleTypeDef \*tim\_baseHandle)
- void [HAL\\_TIM\\_Base\\_MspDeInit](#) (TIM\_HandleTypeDef \*tim\_baseHandle)

### Variables

- TIM\_HandleTypeDef [htim3](#)

#### 7.54.1 Detailed Description

This file provides code for the configuration of the TIM instances.

This software is licensed under terms that can be found in the LICENSE file in the root directory of this software component. If no LICENSE file comes with this software, it is provided AS-IS.

#### 7.54.2 Function Documentation

#### 7.54.2.1 HAL\_TIM\_Base\_MspDeInit()

```
void HAL_TIM_Base_MspDeInit (
    TIM_HandleTypeDef * tim_baseHandle )
```

Definition at line 86 of file tim.c.

#### 7.54.2.2 HAL\_TIM\_Base\_MspInit()

```
void HAL_TIM_Base_MspInit (
    TIM_HandleTypeDef * tim_baseHandle )
```

Definition at line 70 of file tim.c.

#### 7.54.2.3 MX\_TIM3\_Init()

```
void MX_TIM3_Init (
    void )
```

Definition at line 30 of file tim.c.

References Error\_Handler(), and htim3.

Referenced by main().

### 7.54.3 Variable Documentation

#### 7.54.3.1 htim3

```
TIM_HandleTypeDef htim3
```

Definition at line 27 of file tim.c.

Referenced by HAL\_TIM\_PeriodElapsedCallback(), and MX\_TIM3\_Init().

## 7.55 Core/Src/uvfr\_settings.c File Reference

```
#include "uvfr_utils.h"
#include "main.h"
#include "stdlib.h"
```

## Macros

- #define `SRC_UVFR_SETTINGS_C_`

## Functions

- void `setupDefaultSettings` ()  
*Function that allocates the neccessary space for all the vehicle settings, and handles sets all of the settings structs to defaults.*
- void `nukeSettings` (`uv_vehicle_settings` \*\*settings\_to\_delete)
- enum `uv_status_t` `uvSettingsInit` ()  
*this function does one thing, and one thing only, it checks if we have custom settings, then it attempts to get them. If it fails, then we revert to factory defaults.*
- void `uvSettingsProgrammerTask` (void \*args)

## Variables

- `uv_vehicle_settings` \* `current_vehicle_settings` = NULL
- struct `uv_os_settings` `default_os_settings`

### 7.55.1 Macro Definition Documentation

#### 7.55.1.1 SRC\_UVFR\_SETTINGS\_C\_

```
#define SRC_UVFR_SETTINGS_C_
```

Definition at line 7 of file `uvfr_settings.c`.

### 7.55.2 Function Documentation

#### 7.55.2.1 nukeSettings()

```
void nukeSettings (  
    uv_vehicle_settings ** settings_to_delete )
```

Definition at line 51 of file `uvfr_settings.c`.

### 7.55.2.2 `setupDefaultSettings()`

```
void setupDefaultSettings ( )
```

Function that allocates the necessary space for all the vehicle settings, and handles sets all of the settings structs to defaults.

Definition at line 42 of file `uvfr_settings.c`.

References `current_vehicle_settings`, `default_os_settings`, and `uv_vehicle_settings::os_settings`.

Referenced by `uvSettingsInit()`.

### 7.55.2.3 `uvSettingsInit()`

```
enum uv_status_t uvSettingsInit ( )
```

this function does one thing, and one thing only, it checks if we have custom settings, then it attempts to get them. If it fails, then we revert to factory defaults.

Definition at line 64 of file `uvfr_settings.c`.

References `setupDefaultSettings()`, `UV_ABORTED`, `UV_ERROR`, and `UV_OK`.

Referenced by `uvInit()`.

### 7.55.2.4 `uvSettingsProgrammerTask()`

```
void uvSettingsProgrammerTask (
    void * args )
```

Definition at line 88 of file `uvfr_settings.c`.

## 7.55.3 Variable Documentation

### 7.55.3.1 `current_vehicle_settings`

```
uv_vehicle_settings* current_vehicle_settings = NULL
```

Definition at line 15 of file `uvfr_settings.c`.

Referenced by `setupDefaultSettings()`, and `uvInit()`.

## 7.56 Core/Src/uvfr\_state\_engine.c File Reference

File containing the implementation of the vehicle's state engine and error handling infrastructure.

```
#include "uvfr_utils.h"
```

### Data Structures

- struct [state\\_change\\_daemon\\_args](#)

### Macros

- #define [UVFR\\_STATE\\_MACHINE\\_IMPLIMENTATION](#)
- #define [MAX\\_NUM\\_MANAGED\\_TASKS](#) 16

### Typedefs

- typedef struct [state\\_change\\_daemon\\_args](#) [state\\_change\\_daemon\\_args](#)

### Functions

- [uv\\_status](#) [killEmAll](#) ()  
*The name should be pretty self explanatory.*
- void [uvSVCTaskManager](#) (void \*args)  
*oversees all of the service tasks, and makes sure that theyre alright*
- void [uvTaskManager](#) (void \*args) PRIVILEGED\_FUNCTION  
*The big papa task that deals with handling all of the others.*
- int [compareTaskByName](#) ([uv\\_task\\_info](#) \*t1, [uv\\_task\\_info](#) \*t2)
- [uv\\_status](#) [changeVehicleState](#) (uint16\_t state)  
*Function for changing the state of the vehicle, as well as the list of active + inactive tasks.*
- [uv\\_status](#) [uvInitStateEngine](#) ()  
*Function that prepares the state engine to do its thing.*
- [uv\\_status](#) [uvStartStateMachine](#) ()  
*Actually starts up the state engine to do state engine things.*
- [uv\\_status](#) [uvDeInitStateEngine](#) ()  
*Stops and frees all resources used by uvfr\_state\_engine.*
- [uv\\_task\\_info](#) \* [uvCreateTask](#) ()  
*This function gets called when you want to create a task, and register it with the task register. Theres some gnarliness here, but not unacceptable levels. Pray this thing doesn't hang itself.*
- [uv\\_status](#) [addTaskToTaskRegister](#) ([uv\\_task\\_id](#) id, uint8\_t assign\_to\_whom)
- [uv\\_status](#) [\\_uvValidateSpecificTask](#) ([uv\\_task\\_id](#) id)  
*make sure the parameters of a task\_info struct is valid*
- [uv\\_status](#) [uvValidateManagedTasks](#) ()  
*ensure that all the tasks people have created actually make sense, and are valid*
- [uv\\_status](#) [uvStartTask](#) (uint32\_t \*tracker, [uv\\_task\\_info](#) \*t)  
*: This is a function that starts tasks which are already registered in the system*
- static [uv\\_status](#) [uvKillTaskViolently](#) ([uv\\_task\\_info](#) \*t)

- if a task refuses to comply with the SCD, then it has no choice but to be deleted. There is nothing that can be done.*
- [uv\\_status uvDeleteTask](#) (uint32\_t \*tracker, [uv\\_task\\_info](#) \*t)
  - deletes a managed task via the system*
- [uv\\_status uvAbortTaskDeletion](#) ([uv\\_task\\_info](#) \*t)
  - If a task is scheduled for deletion, we want to be able to resurrect it.*
- [uv\\_status uvScheduleTaskDeletion](#) (uint32\_t \*tracker, [uv\\_task\\_info](#) \*t)
  - Schedule a task to be deleted in the future double plus ungood imho.*
- [uv\\_status uvSuspendTask](#) (uint32\_t \*tracker, [uv\\_task\\_info](#) \*t)
  - function to suspend one of the managed tasks.*
- [uv\\_status uvTaskCrashHandler](#) ([uv\\_task\\_info](#) \*t)
  - Called when a task has crashed and we need to figure out what to do with it.*
- void [\\_\\_uvPanic](#) (char \*msg, uint8\_t msg\_len, const char \*file, const int line, const char \*func)
  - Something bad has occurred here now we in trouble.*
- void [killSelf](#) ([uv\\_task\\_info](#) \*t)
  - This function is called by a task to nuke itself. Is a wrapper function that is used to do all the different things.*
- void [suspendSelf](#) ([uv\\_task\\_info](#) \*t)
  - Called by a task that needs to suspend itself, once the task has determined it is safe to do so.*
- static [uv\\_status proccessSCDMsg](#) ([uv\\_scd\\_response](#) \*msg)
  - Helper function for the SCD, that proccesses a message, and double checks to make sure the task that sent the message isn't straight up lying to us.*
- void [uvSendTaskStatusReport](#) ([uv\\_task\\_info](#) \*t)
- void [\\_stateChangeDaemon](#) (void \*args) PRIVILEGED\_FUNCTION
  - This collects all the data changing from different tasks, and makes sure that everything works properly.*
- [uv\\_status uvInvokeSCD](#) (void \*scd\_params)
  - used to wake up the SCD*
- [uv\\_task\\_info](#) \* [uvCreateServiceTask](#) ()
  - Create a new service task, because fuck you, thats why.*
- [uv\\_status uvStartSVCTask](#) ([uv\\_task\\_info](#) \*t)
  - Function to start a service task specifically.*
- [uv\\_status uvSuspendSVCTask](#) ([uv\\_task\\_info](#) \*t)
  - Function that suspends a service task.*
- [uv\\_status uvDeleteSVCTask](#) ([uv\\_task\\_info](#) \*t)
  - For when you need to delete a service task... for some reason...*
- [uv\\_status uvRestartSVCTask](#) ([uv\\_task\\_info](#) \*t)
  - Function that takes a service part that may be messed up and tries to reboot it to recover.*
- [uv\\_task\\_info](#) \* [uvGetTaskFromName](#) (char \*task\_name)
- [uv\\_task\\_info](#) \* [uvGetTaskFromRTOSHandle](#) (TaskHandle\_t t\_handle)
  - Returns the pointer to the task info structure.*

### 7.56.1 Detailed Description

File containing the implementation of the vehicle's state engine and error handling infrastructure.

Author

Byron Oser

### 7.56.2 Macro Definition Documentation

#### 7.56.2.1 UVFR\_STATE\_MACHINE\_IMPLIMENTATION

```
#define UVFR_STATE_MACHINE_IMPLIMENTATION
```

Definition at line 10 of file uvfr\_state\_engine.c.

## 7.57 Core/Src/uvfr\_utils.c File Reference

```
#include "uvfr_utils.h"
```

### Macros

- `#define UV_UTILS_SRC_IMPLIMENTATION`

### Functions

- void `uvInit` (void \*arguments)  
: Function that initializes all of the car's stuff.
- void `uvSysResetDaemon` (void \*args)
- enum `uv_status_t uvUtilsReset` ()  
This function is a soft-reboot of the `uv_utils_backend` and OS abstraction.
- void `setup_extern_devices` (void \*argument)
- void `__uvInitPanic` ()  
Low Level Panic, that does not require the full UVFR utils functionality to be operational.
- void \* `__uvMallocCriticalSection` (size\_t memrequest)  
Wrapper function for `malloc()` that makes it thread safe.
- `uv_status __uvFreeCriticalSection` (void \*ptr)  
Thread-safe wrapper for `free`.
- void \* `__uvMallocOS` (size\_t memrequest)  
`malloc()` wrapper that calls `pvPortMalloc()` rather than `malloc()`
- `uv_status __uvFreeOS` (void \*ptr)  
OS-based free wrapper that calls `pvPortFree`.
- `uv_status uvIsPTRValid` (void \*ptr)  
function that checks to make sure a pointer points to a place it is allowed to point to

## Variables

- TaskHandle\_t [init\\_task\\_handle](#)
- uint8\_t [TxData](#) [8]
- TaskHandle\_t [reset\\_handle](#) = NULL

## 7.57.1 Macro Definition Documentation

### 7.57.1.1 UV\_UTILS\_SRC\_IMPLIMENTATION

```
#define UV_UTILS_SRC_IMPLIMENTATION
```

Definition at line 9 of file `uvfr_utils.c`.

## 7.57.2 Function Documentation

### 7.57.2.1 \_\_uvFreeCritSection()

```
uv_status __uvFreeCritSection (  
    void * ptr )
```

Thread-safe wrapper for `free`.

This is typically called from the macro expansion of `uvFree(x)`

Definition at line 328 of file `uvfr_utils.c`.

References `UV_ERROR`, `UV_OK`, and `uvIsPTRValid()`.

### 7.57.2.2 \_\_uvFreeOS()

```
uv_status __uvFreeOS (  
    void * ptr )
```

OS-based free wrapper that calls `pvPortFree`.

Definition at line 379 of file `uvfr_utils.c`.

References `UV_ERROR`, `UV_OK`, and `uvIsPTRValid()`.

### 7.57.2.3 \_\_uvInitPanic()

```
void __uvInitPanic ( )
```

Low Level Panic, that does not require the full UVFR utils functionality to be operational.

Attention

Calling `_uvInitPanic()` is irreversable and will cause the vehicle to hang itself. This is only to be used as a last resort to stop the vehicle from entering an invalid state.

Definition at line 271 of file `uvfr_utils.c`.

Referenced by `uvInit()`, `uvInitStateEngine()`, and `uvSVCTaskManager()`.

### 7.57.2.4 \_\_uvMallocCritSection()

```
void* __uvMallocCritSection (
    size_t memrequest )
```

Wrapper function for `malloc()` that makes it thread safe.

This typically appears in a macro expansion from `uvMalloc(x)`

Definition at line 292 of file `uvfr_utils.c`.

### 7.57.2.5 \_\_uvMallocOS()

```
void* __uvMallocOS (
    size_t memrequest )
```

`malloc()` wrapper that calls `pvPortMalloc()` rather than `malloc()`

The reason we might want to be using `pvPortMalloc()` rather than regular `stdlib malloc()` is to consolodate the heap between RTOS and non-RTOS functions.

Definition at line 353 of file `uvfr_utils.c`.

References `UV_MALLOC_LIMIT`, `UV_OK`, and `uvIsPTRValid()`.

### 7.57.2.6 setup\_extern\_devices()

```
void setup_extern_devices (
    void * argument )
```

**Deprecated** I really dunno why this still exists, but this gets called somewhere so Im leaving it. I think we just pass it NULL.

Definition at line 259 of file `uvfr_utils.c`.

### 7.57.2.7 uvInit()

```
void uvInit (
    void * arguments )
```

: Function that initializes all of the car's stuff.

This is an RTOS task, and it serves to setup all of the car's different functions. at this point in our execution, we have already initialized all of our favorite hardware peripherals using HAL. Now we get to configure our convoluted system of OS-level settings and state machines.

It executes the following functions, in order:

- Load Vehicle Settings
- Initialize and Start State Machine
- Start Service Tasks, such as CAN, ADC, etc...
- Initialize External Devices such as BMS, IMD, Motor Controller
- Validate that these devices have actually booted up
- Set vehicle state to UV\_READY

Pretty important shit if you ask me.

First on the block is our settings. The uv\_settings are a bit strange, in the following way. We will check if we have saved custom settings, or if these settings are the default or not. It will then perform a checksum on the settings, and validate them to ensure they are safe. If it fails to validate the settings, it will attempt to return to factory default.

If it is unable to return even to factory default settings, then we are in HUGE trouble, and some catastrophic bug has occurred. If it fails to even start this, it will not be safe to drive. We must therefore panic.

Next up we will attempt to initialize the state engine. If this fails, then we are in another case where we are genuinely unsafe to drive. This will create the prototypes for a bajillion tasks that will be started and stopped. Which tasks are currently running, depends on the whims of the state engine. Since the state engine is critical to our ability to handle errors and implausibilities, we cannot proceed without a fully operational state engine.

Once the state machine is initialized we get to actually start the thing.

Once we have initialized the state engine, what we want to do is create the prototypes of all the tasks that will be running.

Now we are going to create a bunch of tasks that will initialize our car's external devices. The reason that these are RTOS tasks, is that it takes a buncha time to verify the existence of some devices. As a direct result, we can sorta just wait around and check that each task sends a message confirming that it has successfully executed. :) However, first we need to actually create a Queue for these tasks to use

```
/*
QueueHandle_t init_validation_queue = xQueueCreate(8, sizeof(uv_init_task_response));
if (init_validation_queue == NULL) {
    __uvInitPanic();
}
```

The next big thing on our plate is checking the status of all external devices we need, and initializing them with appropriate parameters. These are split into tasks because it takes a bit of time, especially for devices that need to be configured via CANBus such as the motor controller. That is why it is split the way it is, to allow these to run somewhat concurrently

```
*/
BaseType_t retval;
//osThreadDef_t MC_init_thread = {"MC_init", MC_Startup, osPriorityNormal, 128, 0};
uv_init_task_args* MC_init_args = uvMalloc(sizeof(uv_init_task_args));
MC_init_args->init_info_queue = init_validation_queue;
```

```

MC_init_args->specific_args = &(current_vehicle_settings->mc_settings);
//MC_init_args->meta_task_handle = osThreadCreate(&MC_init_thread,MC_init_args);
//vTaskResume( MC_init_args->meta_task_handle );
retval =
    xTaskCreate(MC_Startup,"MC_init",128,MC_init_args,osPriorityAboveNormal,&(MC_init_args->meta_task_handle));
if (retval != pdPASS){
    //FUCK
    error_msg = "bruh";
}

```

This thread is for initializing the BMS

```

*/
//osThreadDef_t BMS_init_thread = {"BMS_init",BMS_Init,osPriorityNormal,128,0};
uv_init_task_args* BMS_init_args = uvMalloc(sizeof(uv_init_task_args));
BMS_init_args->init_info_queue = init_validation_queue;
BMS_init_args->specific_args = &(current_vehicle_settings->bms_settings);
//BMS_init_args->meta_task_handle = osThreadCreate(&BMS_init_thread,BMS_init_args);
retval =
    xTaskCreate(BMS_Init,"BMS_init",128,BMS_init_args,osPriorityAboveNormal,&(BMS_init_args->meta_task_handle));
if (retval != pdPASS){
    //FUCK
    error_msg = "bruh";
}

```

This variable is a tracker that tracks which devices have successfully initialized

```

*/
uv_init_task_args* IMD_init_args = uvMalloc(sizeof(uv_init_task_args));
IMD_init_args->init_info_queue = init_validation_queue;
IMD_init_args->specific_args = &(current_vehicle_settings->imd_settings);
retval =
    xTaskCreate(initIMD,"BMS_init",128,IMD_init_args,osPriorityAboveNormal,&(IMD_init_args->meta_task_handle));
if (retval != pdPASS){
    //FUCK
    error_msg = "bruh";
}
uv_init_task_args* PDU_init_args = uvMalloc(sizeof(uv_init_task_args));
PDU_init_args->init_info_queue = init_validation_queue;
PDU_init_args->specific_args = &(current_vehicle_settings->imd_settings);
retval =
    xTaskCreate(initPDU,"PDU_init",128,PDU_init_args,osPriorityAboveNormal,&(PDU_init_args->meta_task_handle));
//pass in the right settings, dum dum
if (retval != pdPASS){
    //FUCK
    error_msg = "bruh";
}
uint16_t ext_devices_status = 0x000F; //Tracks which devices are currently setup

```

Wait for all the spawned in tasks to do their thing. This should not take that long, but we wanna be sure that everything is chill If we are say, missing a BMS, then it will not allow you to proceed past the initialisation step This is handled by a message buffer, that takes inputs from all of the tasks

We allocate space for a response from the initialization.

Clean up, clean up, everybody clean up, clean up, clean up, everybody do your share! The following code cleans up all the threads that were running, and free up used memory

Definition at line 39 of file uvfr\_utils.c.

References `__uvInitPanic()`, `BMS_Init()`, `uv_vehicle_settings::bms_settings`, `changeVehicleState()`, `current_vehicle_settings`, `uv_init_task_response::device`, `uv_init_task_response::errmsg`, `uv_vehicle_settings::imd_settings`, `INIT_CHECK_PERIOD`, `uv_init_task_args::init_info_queue`, `init_task_handle`, `initIMD()`, `initPDU()`, `MAX_INIT_TIME`, `uv_vehicle_settings::mc_settings`, `MC_Startup()`, `uv_init_task_args::meta_task_handle`, `uv_init_task_response::nchar`, `uv_init_task_args::specific_args`, `uv_init_task_response::status`, `UV_OK`, `UV_READY`, `uvInitStateEngine()`, `uvSettingsInit()`, and `uvStartStateMachine()`.

Referenced by `MX_FREERTOS_Init()`.

### 7.57.2.8 uvIsPTRValid()

```
uv_status uvIsPTRValid (
    void * ptr )
```

function that checks to make sure a pointer points to a place it is allowed to point to

The primary motivation for this is to avoid trying to dereference a pointer that doesn't exist, and triggering the `HardFaultHandler()`. That is never a fun time. This allows us to exit gracefully instead of getting stuck in an IRQ handler

Exiting gracefully can be pretty neat sometimes.

Definition at line 401 of file `uvfr_utils.c`.

References `UV_ERROR`, `UV_OK`, and `UV_WARNING`.

Referenced by `__uvFreeCriticalSection()`, `__uvFreeOS()`, and `__uvMallocOS()`.

### 7.57.2.9 uvSysResetDaemon()

```
void uvSysResetDaemon (
    void * args )
```

Definition at line 233 of file `uvfr_utils.c`.

Referenced by `uvUtilsReset()`.

### 7.57.2.10 uvUtilsReset()

```
enum uv_status_t uvUtilsReset ( )
```

This function is a soft-reboot of the `uv_utils_backend` and OS abstraction.

The idea here is to basically start from a blank slate and boot up everything. So therefore we must:

- Halt state machine.
- Nuke vehicle operation related tasks.
- Nuke the state machine
- Nuke old settings

reinitialize `uv_utils`

Definition at line 250 of file `uvfr_utils.c`.

References `reset_handle`, `UV_OK`, and `uvSysResetDaemon()`.

### 7.57.3 Variable Documentation

#### 7.57.3.1 init\_task\_handle

TaskHandle\_t init\_task\_handle

Definition at line 51 of file freertos.c.

Referenced by MX\_FREERTOS\_Init(), and uvInit().

#### 7.57.3.2 reset\_handle

TaskHandle\_t reset\_handle = NULL

Definition at line 15 of file uvfr\_utils.c.

Referenced by uvUtilsReset().

#### 7.57.3.3 TxData

uint8\_t TxData[8]

Definition at line 7 of file constants.c.

## 7.58 Core/Src/uvfr\_vehicle\_commands.c File Reference

```
#include "uvfr_utils.h"
```

### Functions

- void [uvSecureVehicle](#) ()  
*Function to put vehicle into safe state.*

### 7.58.1 Function Documentation

#### 7.58.1.1 uvSecureVehicle()

void uvSecureVehicle ( )

Function to put vehicle into safe state.

Should perform the following functions in order:

- Prevent new MC torque or speed requests
- Open shutdown cct

Definition at line 11 of file uvfr\_vehicle\_commands.c.

Referenced by \_\_uvPanic().
